# Outline

- ▶ Snapshot of the desert from Higgs to Planck:  
Vacuum, scalar fields, hierarchy, unification
- ▶ Filling the desert: new scales and new physics  
supersymmetry and compositeness
- ▶ Role of conformal symmetry
- ▶ Flavour physics and BSM
- ▶ After the LHC

# Disparate Scales

Is the LHC announcing a desert up to the Planck scale?

## It cannot be a desert

Dark energy (the cosmological constant problem)

Dark matter

Baryon Asymmetry

Neutrinos: Majorana and Dirac

Muon  $g-2$

Electric Dipole Moments (EDMs)

Cosmology  
& Astronomy

Particle Physics

• • •

Can one scalar (Higgs) field and some massive neutrinos  
explain it all ?  
i.e. the evolution of our Universe

Find an answer to the following questions:

Stability of the EW vacuum

Renormalization of scalar masses (naturalness)

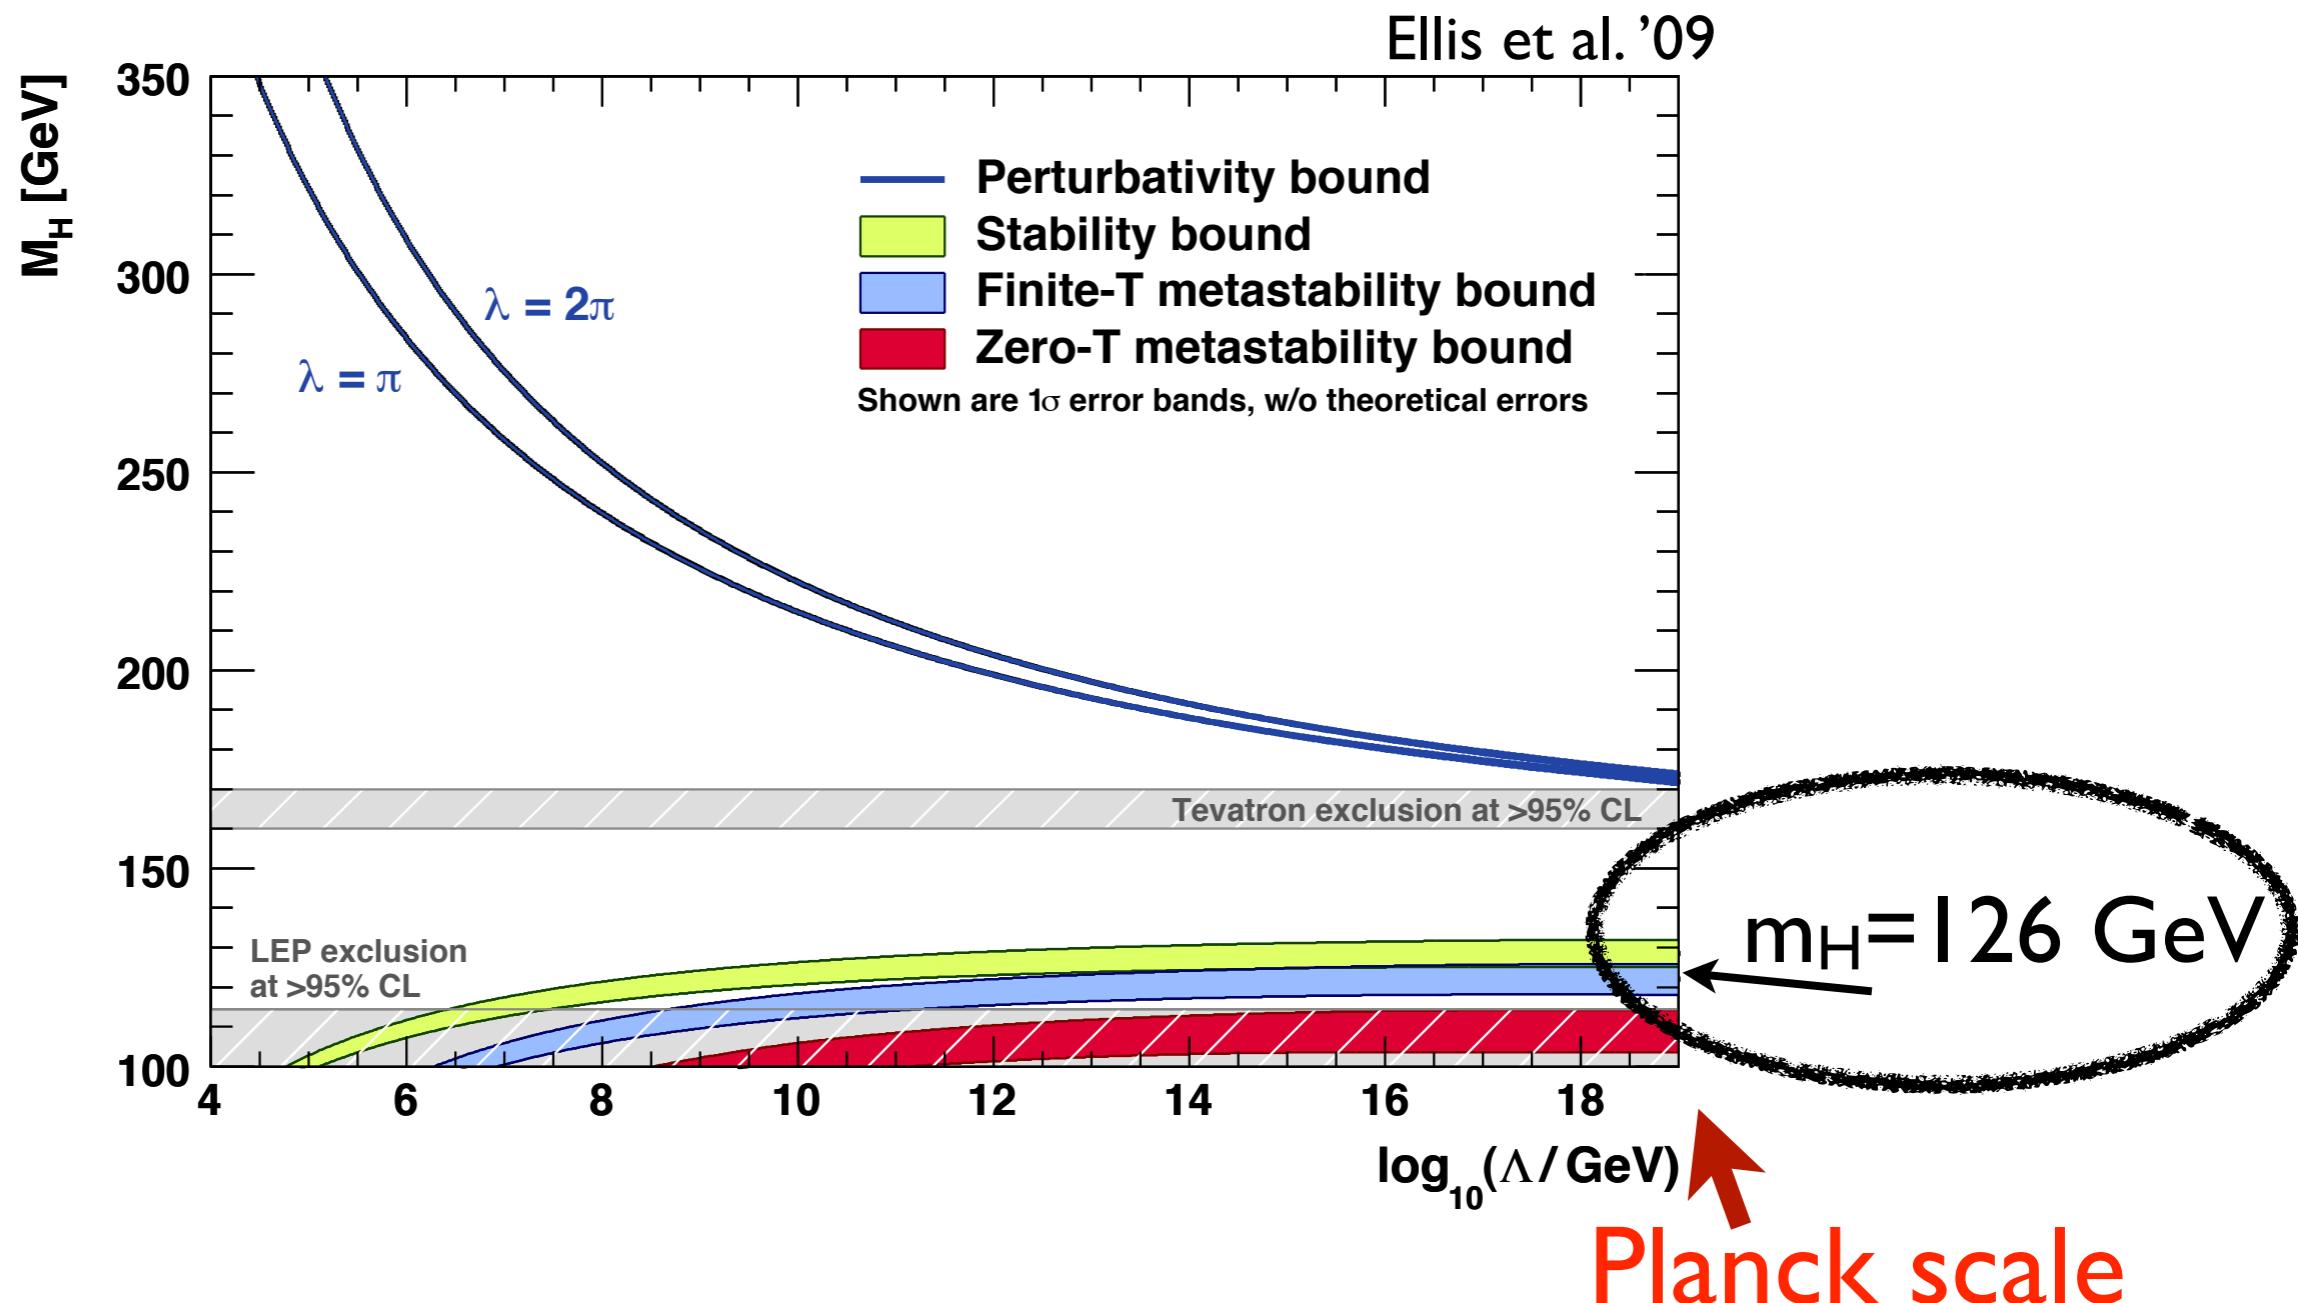

Hierarchy of scales (gauge hierarchy problem)

Unification

# Stability of the EW vacuum

⇒ triviality and radiative corrections Cortese Petronzio EP '92

⇒ vacuum stability Isidori Ridolfi Strumia '01

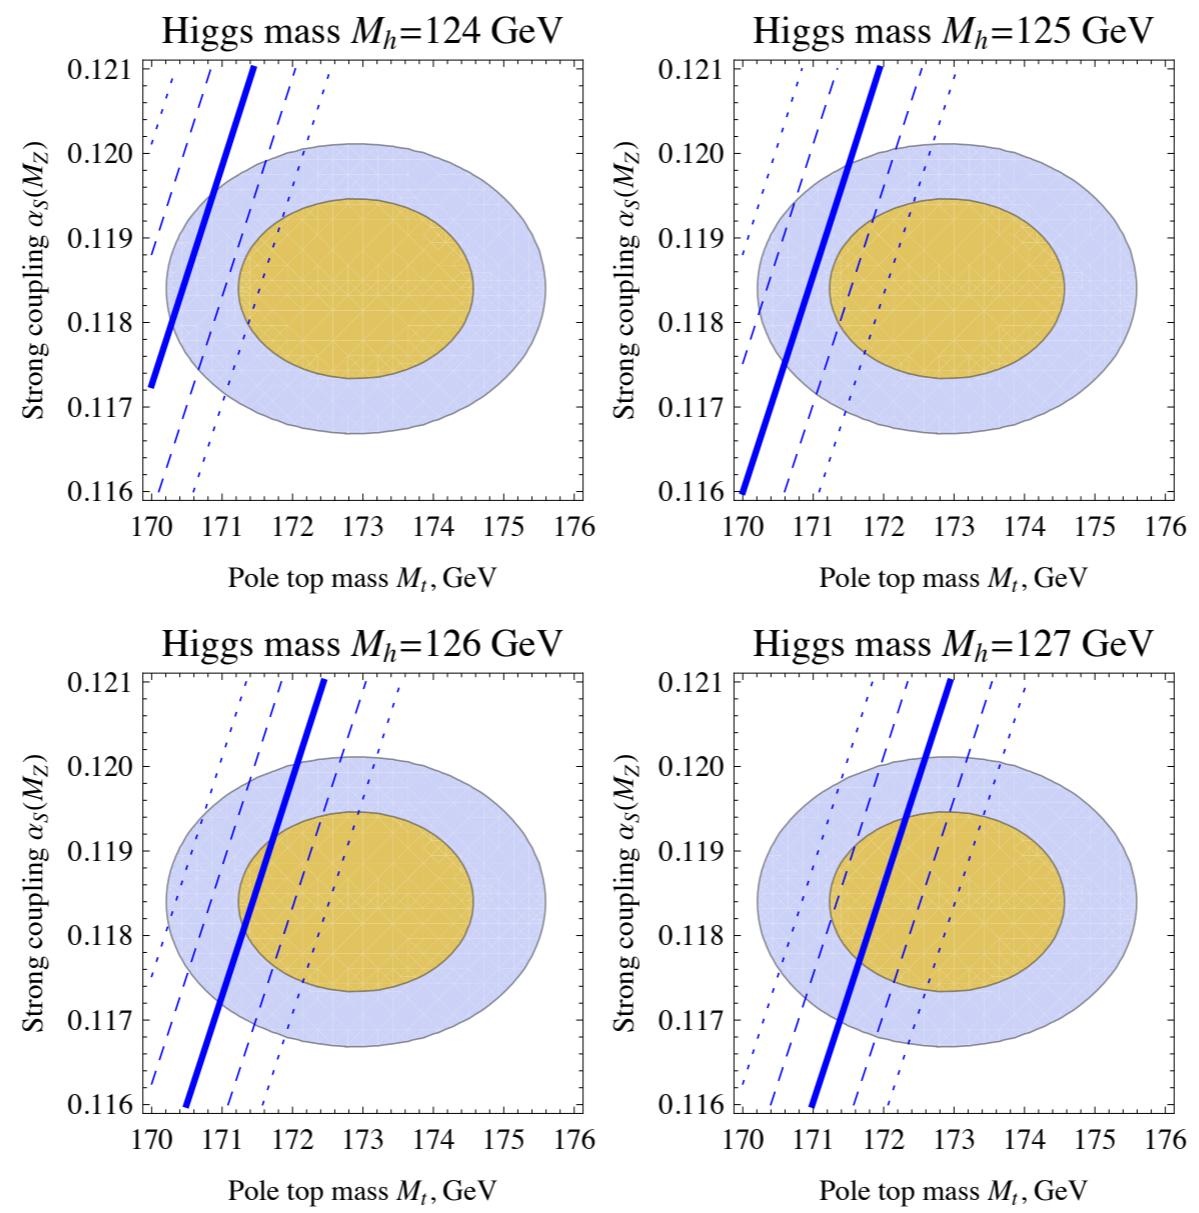

The SM may be a valid EFT up to the Planck scale

# Updated stability bound

Bezrukov, Kalmykov, Kniehl, Shaposhnikov 2012

$$M_{\min} = \left[ 128.95 + \frac{M_t - 172.9 \text{ GeV}}{1.1 \text{ GeV}} \times 2.2 - \frac{\alpha_s - 0.1184}{0.0007} \times 0.56 \right] \text{ GeV}$$

Present uncertainties do not allow to conclude if  $M_H=124 - 127 \text{ GeV}$  indicates stability or metastability of the SM vacuum

# Higgs & the Evolving Universe

LEP and LHC tell us that  $M_H > M_{\text{metastability}}$  : we live in a vacuum with lifetime at least larger than the age of the Universe  $\Rightarrow$  NP is not needed to stabilise the SM vacuum

A numerical coincidence ?

UV stability scale predicted by SM parameters is about the Planck scale

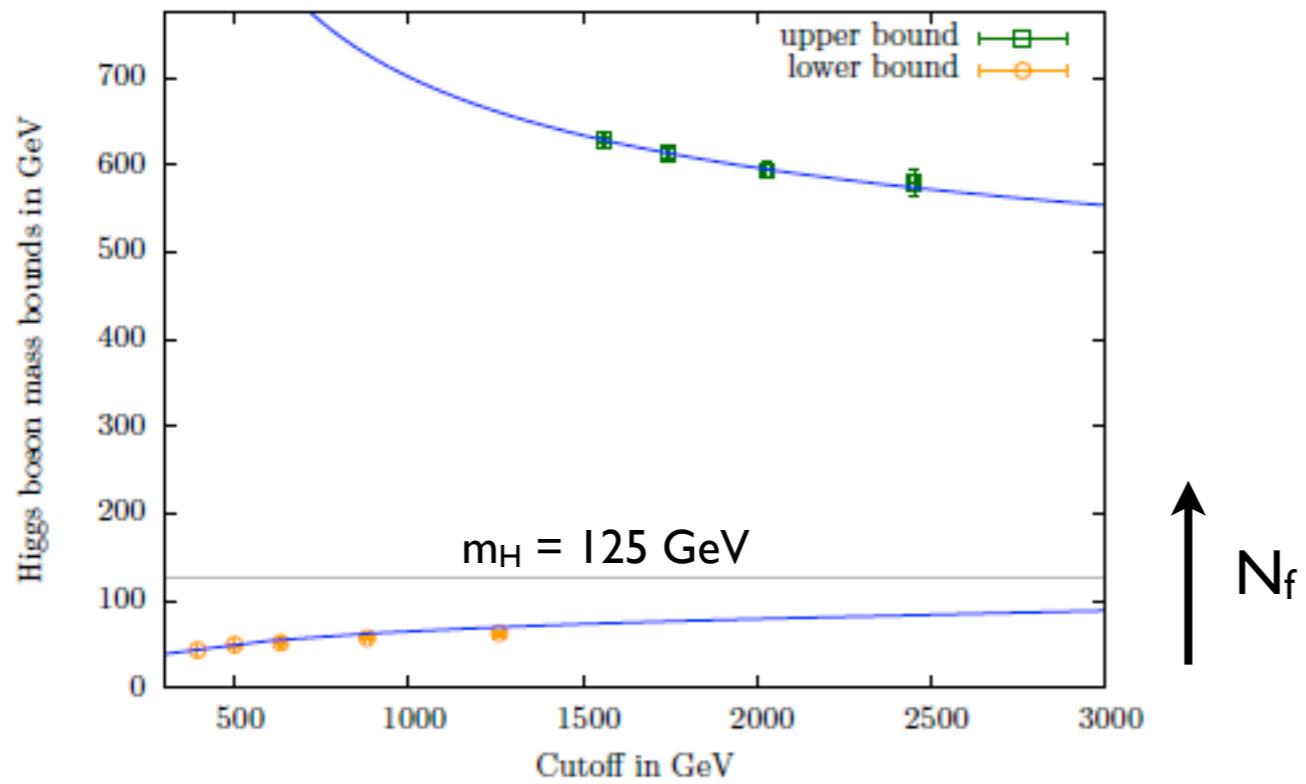

# Lattice stability bound

Hedge et al. Adv. High Energy Phys. 2013 (2013) 875612

$$\mathcal{L}_{F+Y}[\bar{\psi}, \psi, \phi] = \bar{\psi} D_{ov} \psi + y_b (\bar{t}, \bar{b})_L \phi b_R + y_t (\bar{t}, \bar{b})_L \tilde{\phi} t_R + h.c.$$

Overlap fermions with exact  $SU(2)_L \times U(1)_R$  chiral symmetry

$\Lambda = 1/a$     $\Lambda \sim 10^{10}$  GeV inaccessible

4th fermion generation excluded  
( $m_t > 350$  GeV exp. constraint)

# Renormalization of scalar masses (naturalness)

Q: Well posed question or inappropriate use of regularization?

## SM scalar mass

$$\delta m_h^2 = -4 \sum_f m_f^2 \frac{\Lambda^2}{v^2} + (2m_W^2 + m_Z^2 + m_h^2) \frac{\Lambda^2}{v^2}$$

conformal symmetry broken

## SM fermion mass

$$\delta m_f = A m_f \ln \frac{\Lambda}{v} \quad A > 0$$

chiral symmetry protection

# Rescued by scale invariance (conformal symmetry)

$$T_\mu^\mu \sim \sum_i \beta_i(\{g\}, \{\lambda\}) \cdot O_i^{(d=4)} + \text{mass terms}$$

$$T_{\mu \text{ classical}}^\mu = 2m_h^2 h^\dagger h$$

$$T_{\mu \text{ one loop}}^\mu = 2\delta m_h^2 h^\dagger h + \sum_i \beta_i(\{g\}, \{\lambda\}) \cdot O_i^{(d=4)}$$

$\delta m_h^2 \sim \Lambda^2 \longrightarrow$  explicit breaking of conformal symmetry

$\delta m_h^2 \sim m_h^2 \longrightarrow$  spontaneous breaking of conformal symmetry

Introduce a dilaton field

## Exercise: classical scalar theory

[S. Coleman ‘Aspects of symmetry’]

$$\mathcal{L}_m = -\frac{1}{2}m^2\phi^2 \rightarrow -\frac{1}{2}m^2\phi^2 e^{2f\sigma}$$

$$\int d^4x \delta\mathcal{L}_m = 0$$

$$\chi(x) = \frac{1}{f}e^{f\sigma(x)}$$

dilaton field  
= Goldstone boson of scale (conformal) invariance

Realize PCDC by adding a mass term for the dilaton

$$\mathcal{L}_B = -\frac{1}{2}m_\sigma^2\sigma^2 + O(\sigma^3) \longrightarrow \partial_\mu s^\mu = T_\mu^\mu = -\frac{m_\sigma^2}{f}\sigma$$

Extend to the quantized theory

Open questions: unitarity, uniqueness, which SM sectors?

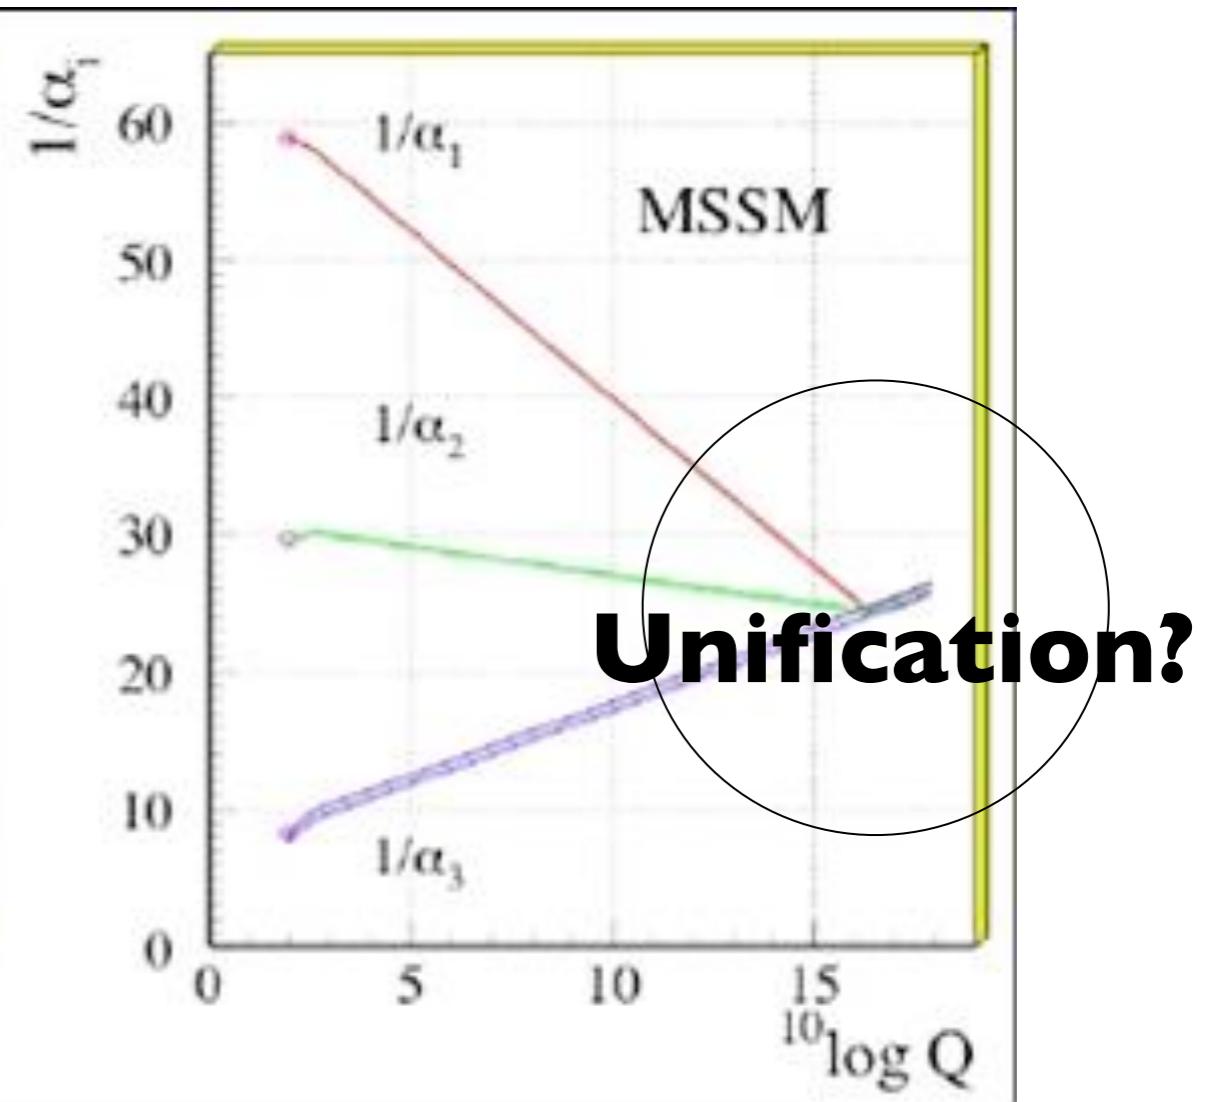

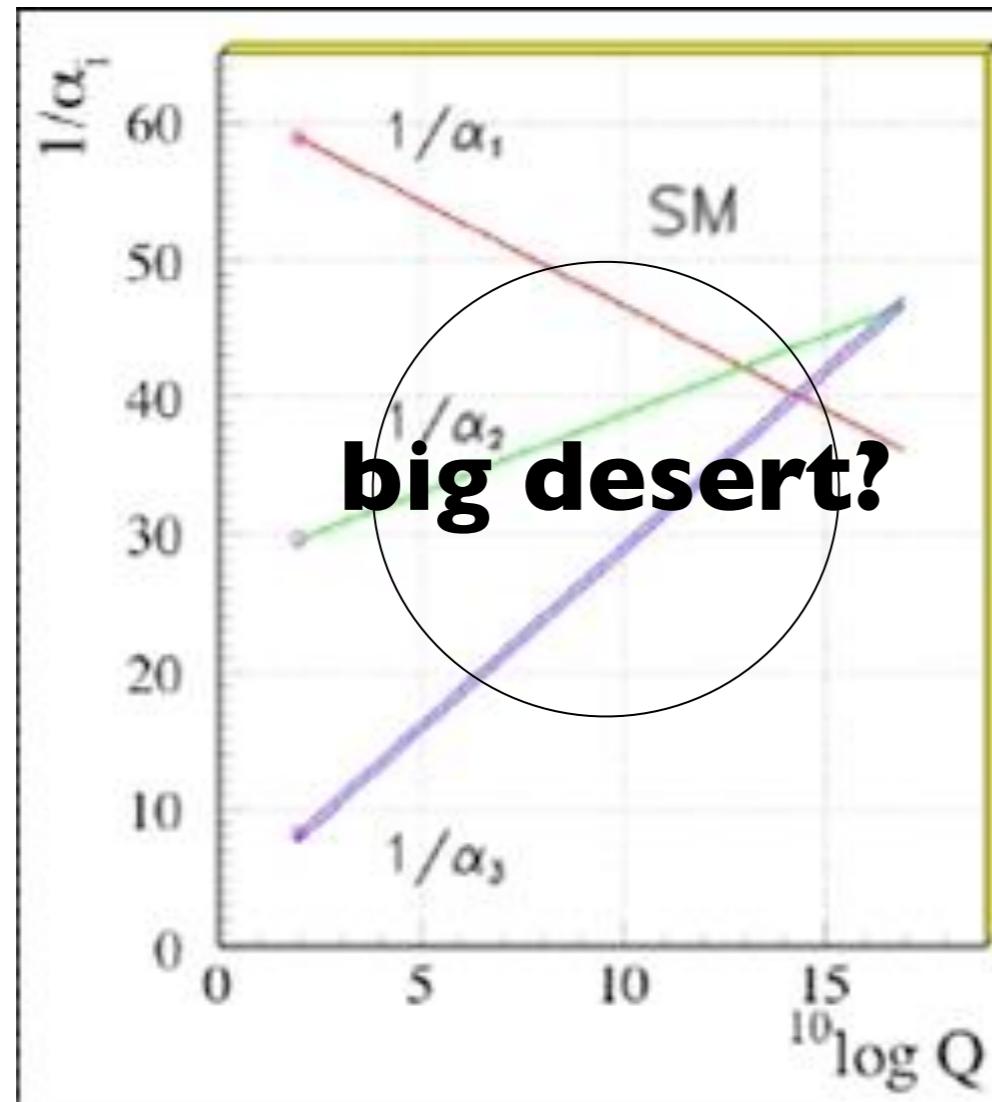

[see e.g. Shaposhnikov, Zenhausern arXiv:0809.3406]

scalar sector:  $\frac{1}{2}m_{Higgs}^2 H^2 \rightarrow \frac{1}{2}\partial_\mu\chi\partial^\mu\chi - \lambda(H^2 - \zeta^2\chi^2)^2$

# Hierarchy of scales and unification of forces

Q: Are there new relevant scales between Higgs/Fermi and Planck?

## Two known scenarios

## Two avenues

Add new scales  
 $\Leftrightarrow$  new particles

e.g.  
(weakly coupled) supersymmetry  
(strongly coupled) compositeness

No new scale  
 $\Leftrightarrow$  minimal particle content

e.g.  
Conformal symmetry at Planck  
Need to break it spontaneously

|

$10^3$

$10^{19}$  GeV

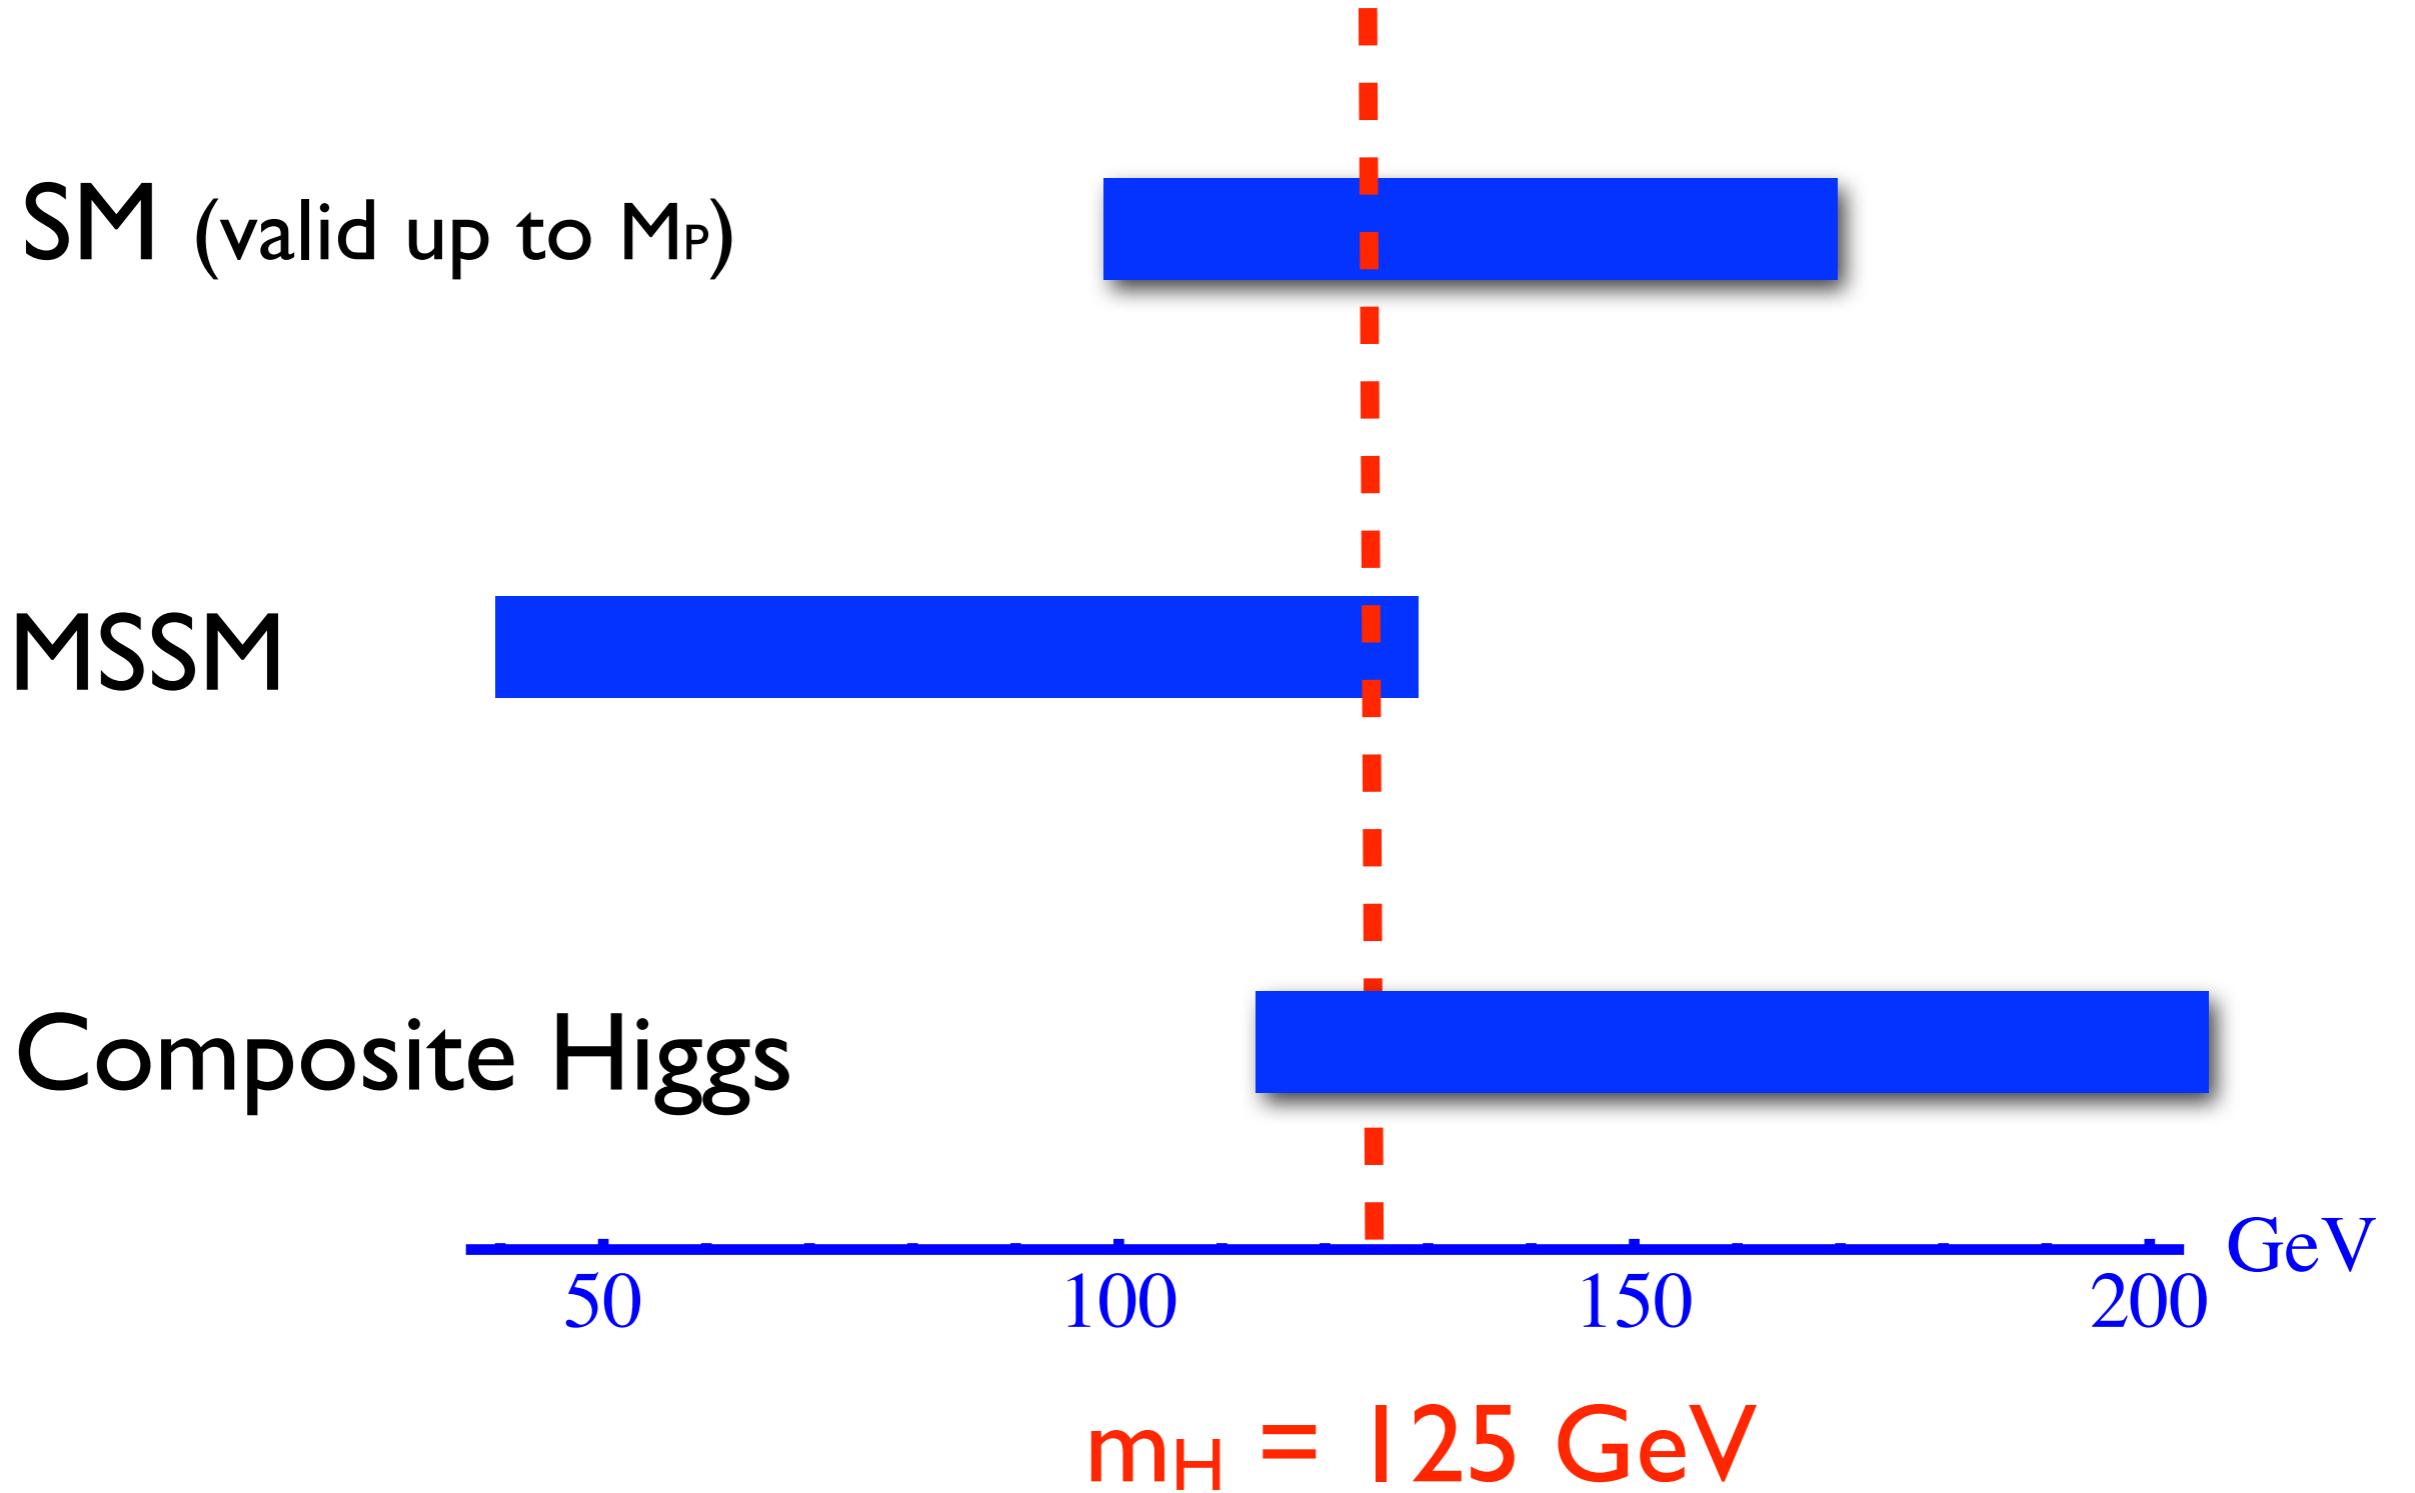

compositeness ?  
supersymmetry breaking ?

confinement ElectroWeak

Planck

# Higgs mass range

Pomarol @ICHEP12

Main stream solutions have invoked the criterion of naturalness (along with unification of gauge forces) for the last 40 years

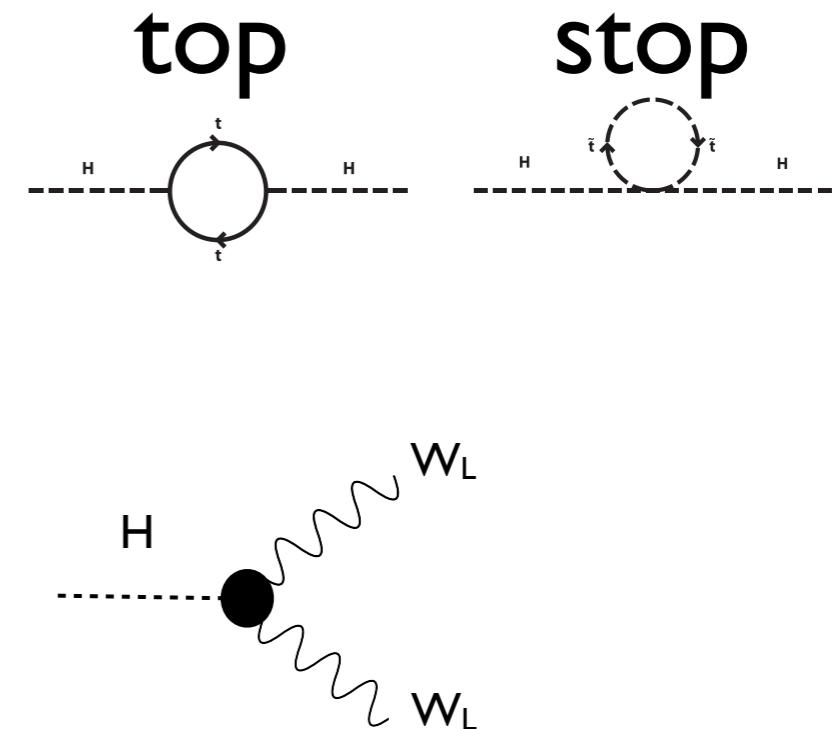

**SUPERSYMMETRY**

Djouadi 08

**COMPOSITENESS**

Bhattacharyya II

**without or with extra spatial dimensions** (RS,ADD, etc)

# Compositeness

Superconductivity

Cooper pairs  $\langle ee \rangle$   
weakly coupled

Confinement

quark condensate  $\langle qq \rangle$   
strongly coupled

Postulate strong dynamics BSM (no decoupling of h.o. operators)  
→ light composite Higgs

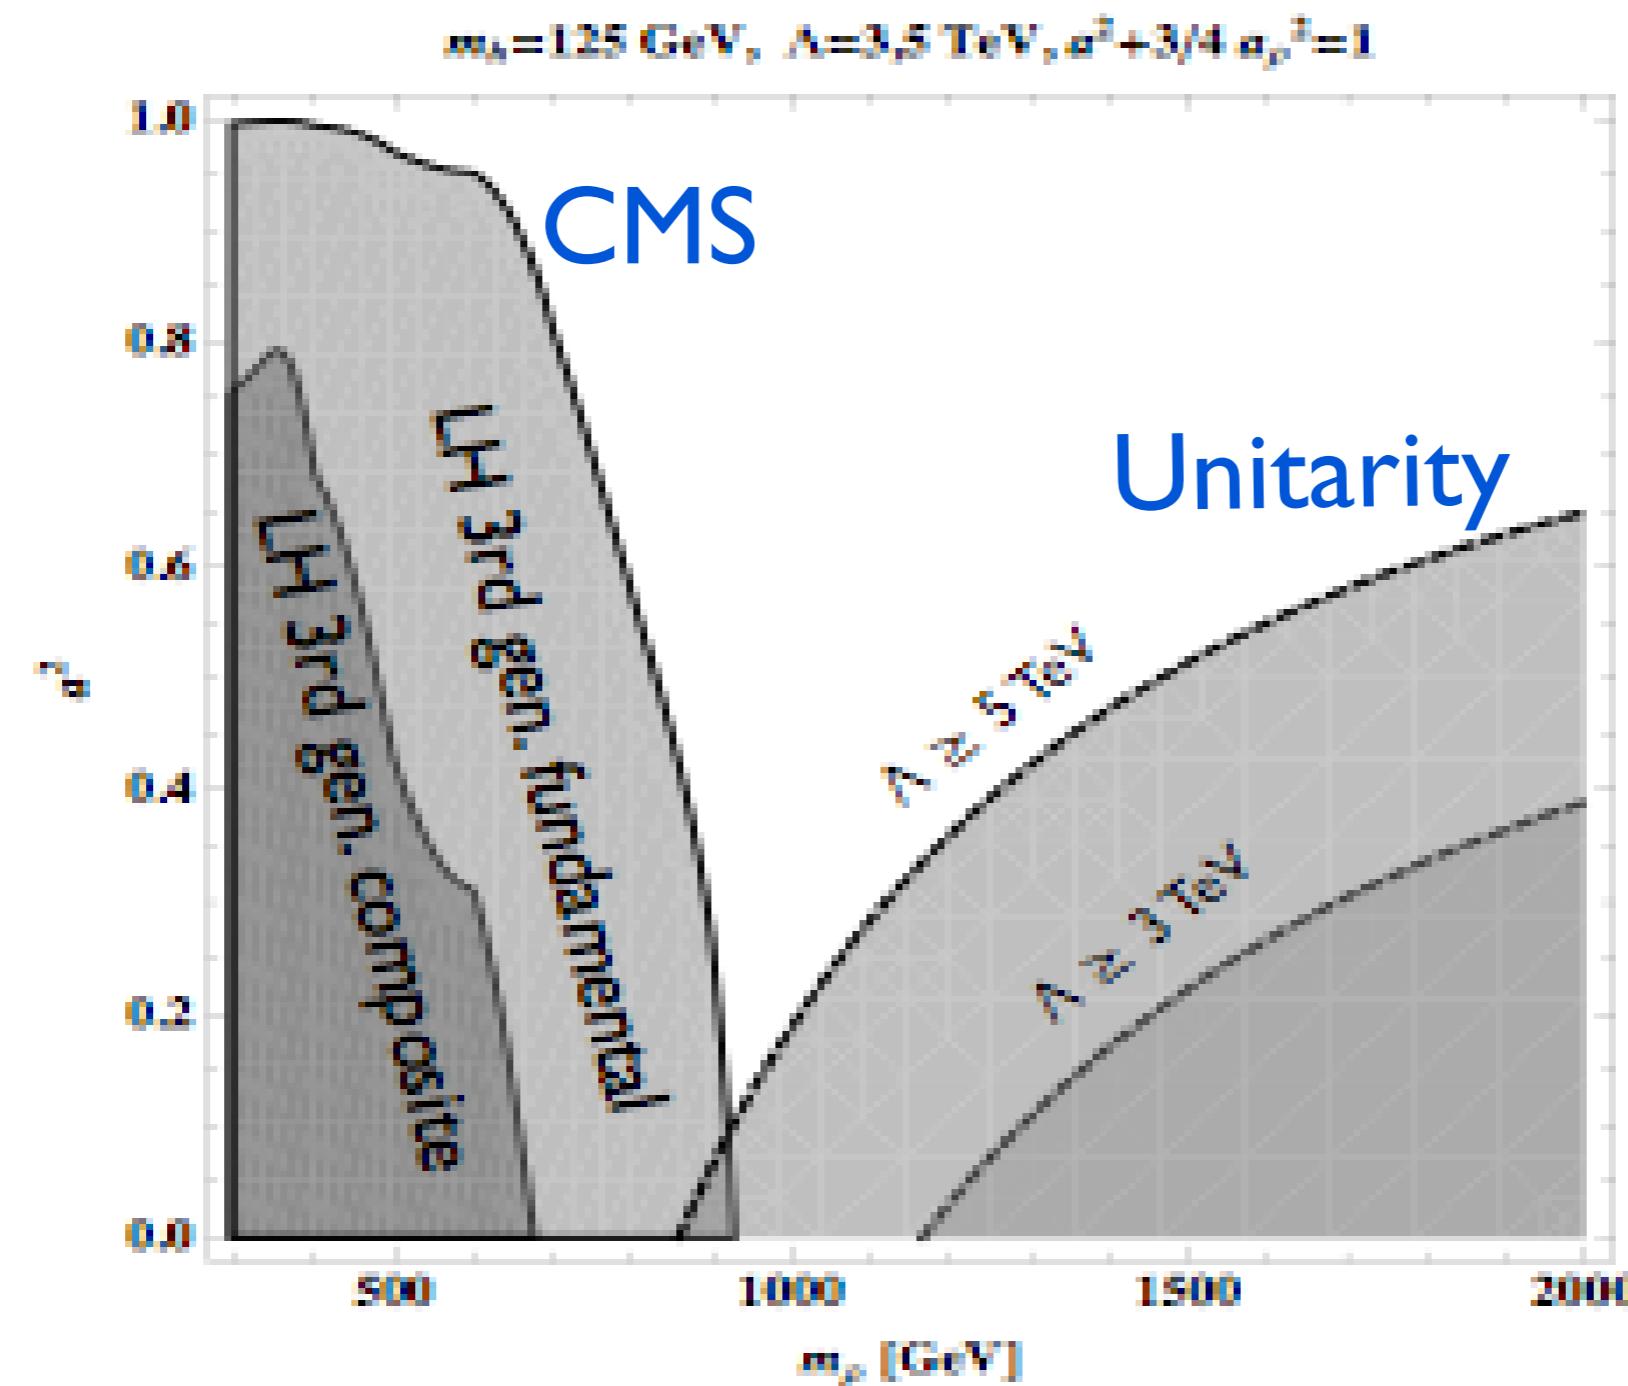

The Higgs boson can be the pNGB of an extended global symmetry or the dilaton of a spontaneously broken CFT  $\Rightarrow$  SM couplings modified

LHC data constrain the compositeness scale and the spectrum

The more the couplings deviate from the SM, the lighter the **new composites** (resonances) must be to ensure unitarity up to the compositeness scale  $\Lambda$

The Higgs postpones the onset of the vector resonance to higher masses w.r.t. to Higgsless models  $\Rightarrow$  improve compatibility with LHC constraints

Strongest direct constraints on the  $\rho$  come from di-boson searches at LHC  
 $\rho^\pm \rightarrow W^\pm Z \rightarrow 3 l + \nu$ .

From CMS results the interesting range  $700 \text{ GeV} < m_\rho < 2 \text{ TeV}$  is allowed

$L=4.7 \text{ fb}^{-1}, 7 \text{ TeV}$ [CONF-2012-076]	93-180 GeV	$\tilde{l}$ mass ( $m(\tilde{\chi}_1^0) = 0$ )
$L=4.7 \text{ fb}^{-1}, 7 \text{ TeV}$ [CONF-2012-076]	120-330 GeV	$\tilde{\chi}_1^\pm$ mass ( $m(\tilde{\chi}_1^0) = 0, m(l, \tilde{\nu}) = \frac{1}{2}(m(\tilde{\chi}_1^+) + m(\tilde{\chi}_1^0))$ )
$L=4.7 \text{ fb}^{-1}, 7 \text{ TeV}$ [CONF-2012-077]	60-500 GeV	$\tilde{\chi}_1^\pm$ mass ( $m(\tilde{\chi}_1^+) = m(\tilde{\chi}_2^0), m(\tilde{\chi}_1^0) = 0, m(l, \tilde{\nu})$ as above)
$L=4.7 \text{ fb}^{-1}, 7 \text{ TeV}$ [CONF-2012-034]	118 GeV	$\tilde{\chi}_1^\pm$ mass ( $1 < \tau(\tilde{\chi}_1^\pm) < 2 \text{ ns}$ , 90 GeV limit in [0.2, 90] ns)
$L=4.7 \text{ fb}^{-1}, 7 \text{ TeV}$ [ATLAS-CONF-2012-075]	985 GeV	$\tilde{g}$ mass
$L=4.7 \text{ fb}^{-1}, 7 \text{ TeV}$ [ATLAS-CONF-2012-075]	612 GeV	$\tilde{b}$ mass
$L=4.7 \text{ fb}^{-1}, 7 \text{ TeV}$ [ATLAS-CONF-2012-075]	683 GeV	$\tilde{t}$ mass
$L=4.7 \text{ fb}^{-1}, 7 \text{ TeV}$ [ATLAS-CONF-2012-075]	910 GeV	$\tilde{g}$ mass ( $\tau(\tilde{g}) > 10 \text{ ns}$ )
$L=4.7 \text{ fb}^{-1}, 7 \text{ TeV}$ [ATLAS-CONF-2012-075]	310 GeV	$\tilde{\tau}$ mass ( $5 < \tan\beta < 20$ )
$L=1.1 \text{ fb}^{-1}, 7 \text{ TeV}$ [1109.3089]	1.32 TeV	$\tilde{\nu}_\tau$ mass ( $\lambda_{311}=0.10, \lambda_{312}=0.05$ )
$L=1.0 \text{ fb}^{-1}, 7 \text{ TeV}$ [1109.6606]	760 GeV	$\tilde{q} = \tilde{g}$ mass ( $c\tau_{\text{LSP}} < 15 \text{ mm}$ )
$L=2.1 \text{ fb}^{-1}, 7 \text{ TeV}$ [ATLAS-CONF-2012-035]	1.77 TeV	$\tilde{g}$ mass
$L=34 \text{ pb}^{-1}, 7 \text{ TeV}$ [1110.2693]	100-185 GeV	s gluon mass (not excluded: $m_{\text{sg}} \approx 140 \pm 3 \text{ GeV}$ )
$L=4.7 \text{ fb}^{-1}, 7 \text{ TeV}$ [ATLAS-CONF-2012-084]	709 GeV	$M^*$ scale ( $m_\chi < 100 \text{ GeV}$ , vector D5, Dirac $\chi$ )
$L=4.7 \text{ fb}^{-1}, 7 \text{ TeV}$ [ATLAS-CONF-2012-084]	548 GeV	$M^*$ scale ( $m_\chi < 100 \text{ GeV}$ , tensor D9, Dirac $\chi$ )

$\int L dt = (0.03 - 4.8) \text{ fb}^{-1}$   
 $\sqrt{s} = 7 \text{ TeV}$

ATLAS  
Preliminary

Mass scale [TeV]

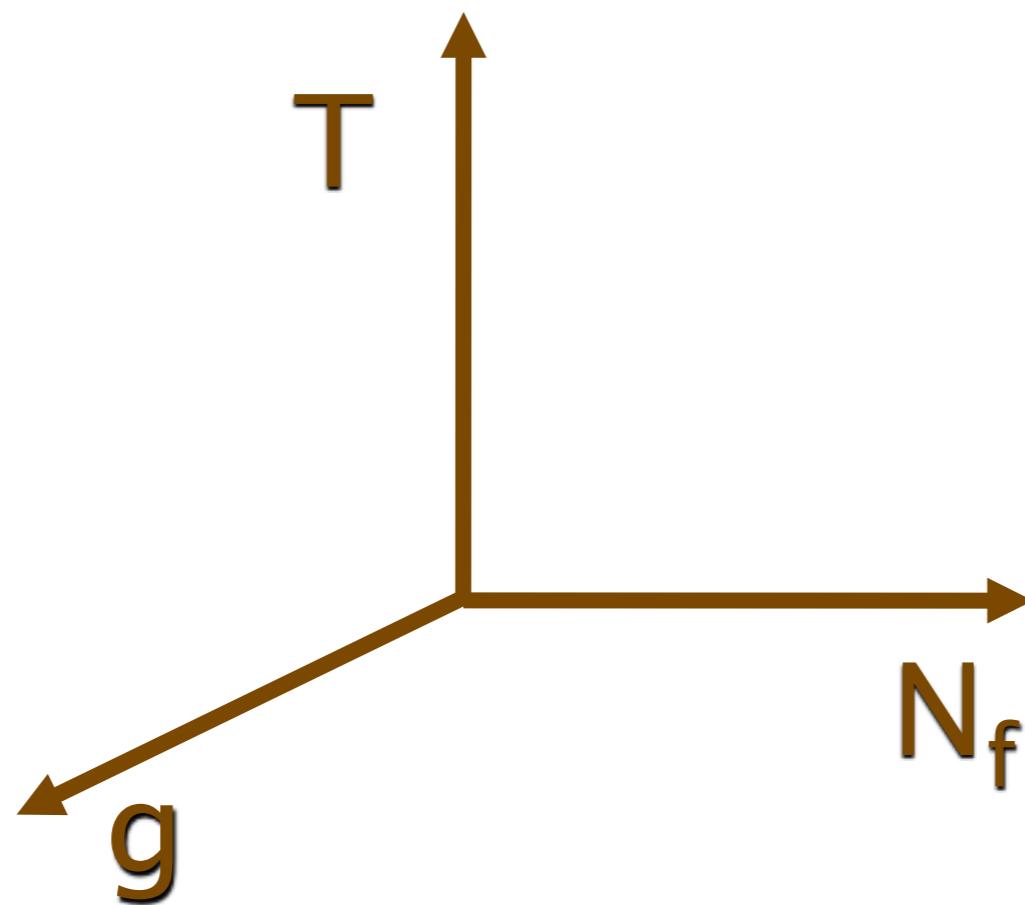

\* Only a selection of the available mass limits on new states or phenomena shown.

# More on the role of Conformal Symmetry

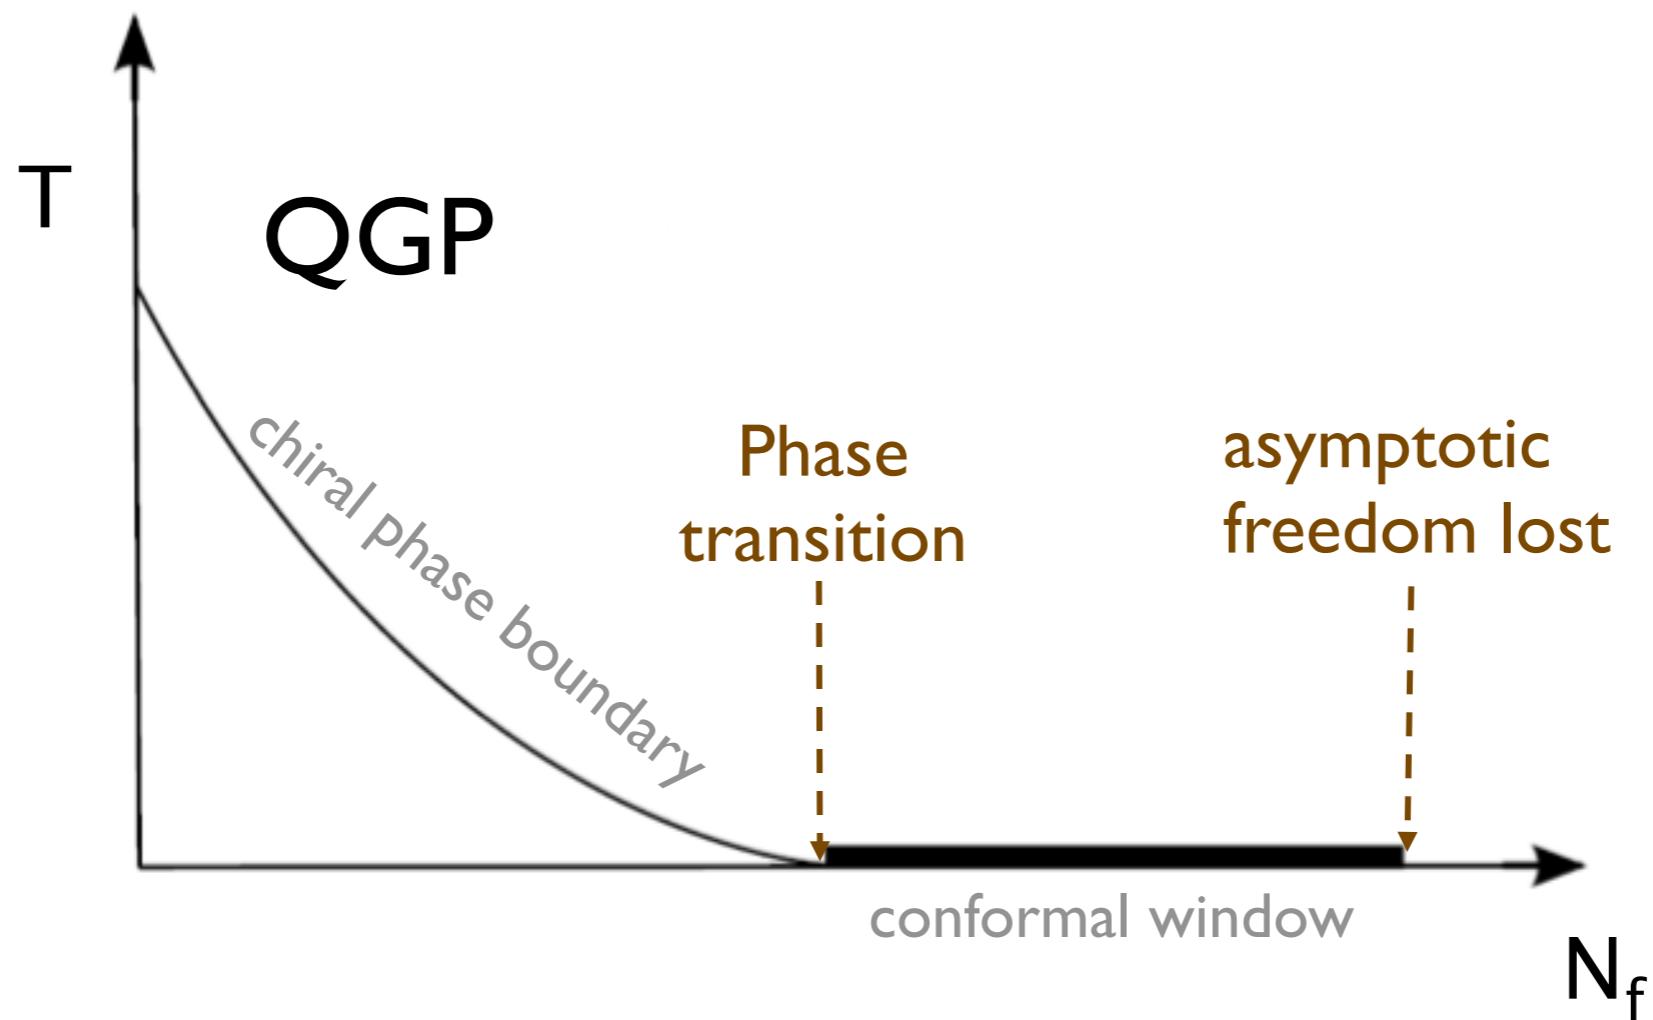

A pedagogical example

What is the fixed point structure of fundamental forces?

# The phase diagram of $SU(N)$ gauge theories

# QCD: fundamental fermions

Physics of:

- ✓ quark gluon plasma (QGP): high  $T$  - low  $N_f$
- ✓ preconformal regime ( $T=0$ , low  $T$  - high  $N_f$ )
- ✓ conformal regime ( $T=0$ )

# Less flavour for larger Casimir

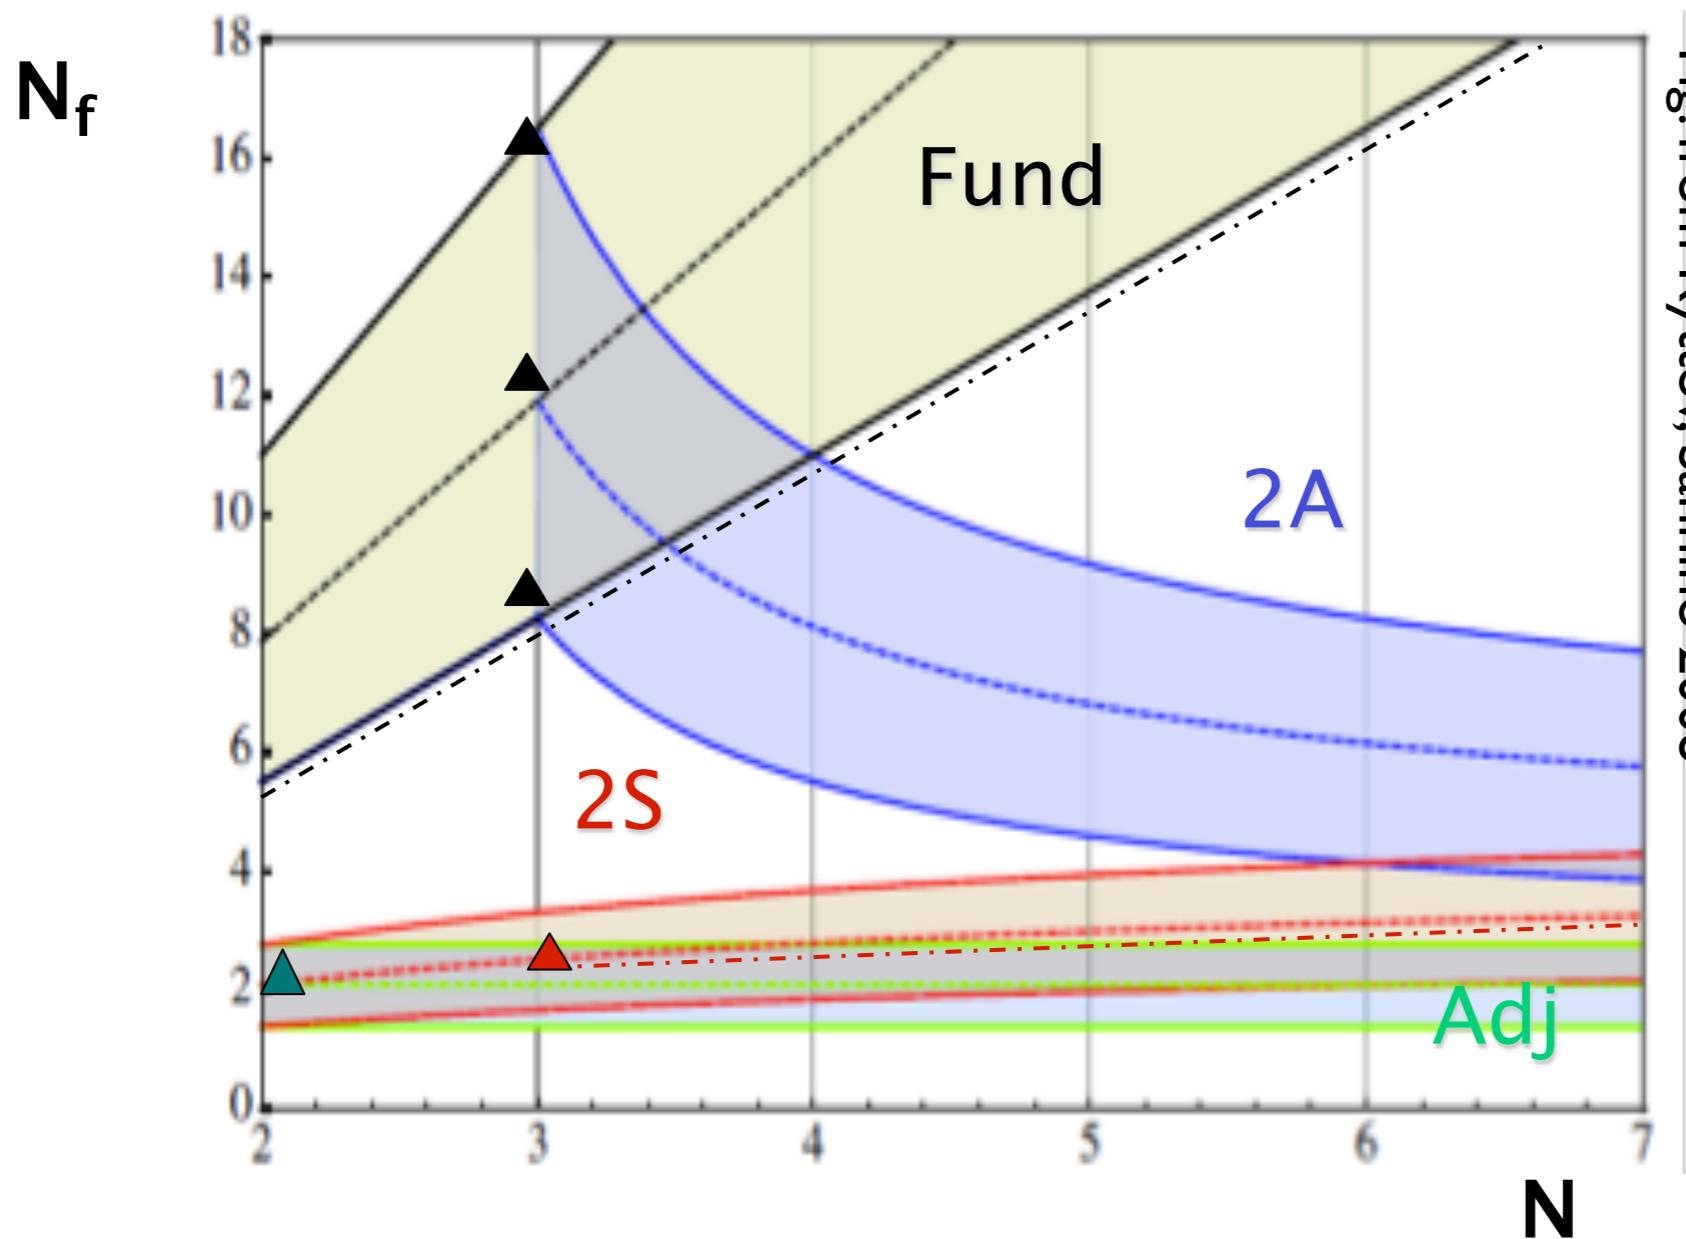

Fig. from Ryttov, Sannino 2008

$$\beta(g) = -b_0 g^3 - b_1 g^5 + \dots$$

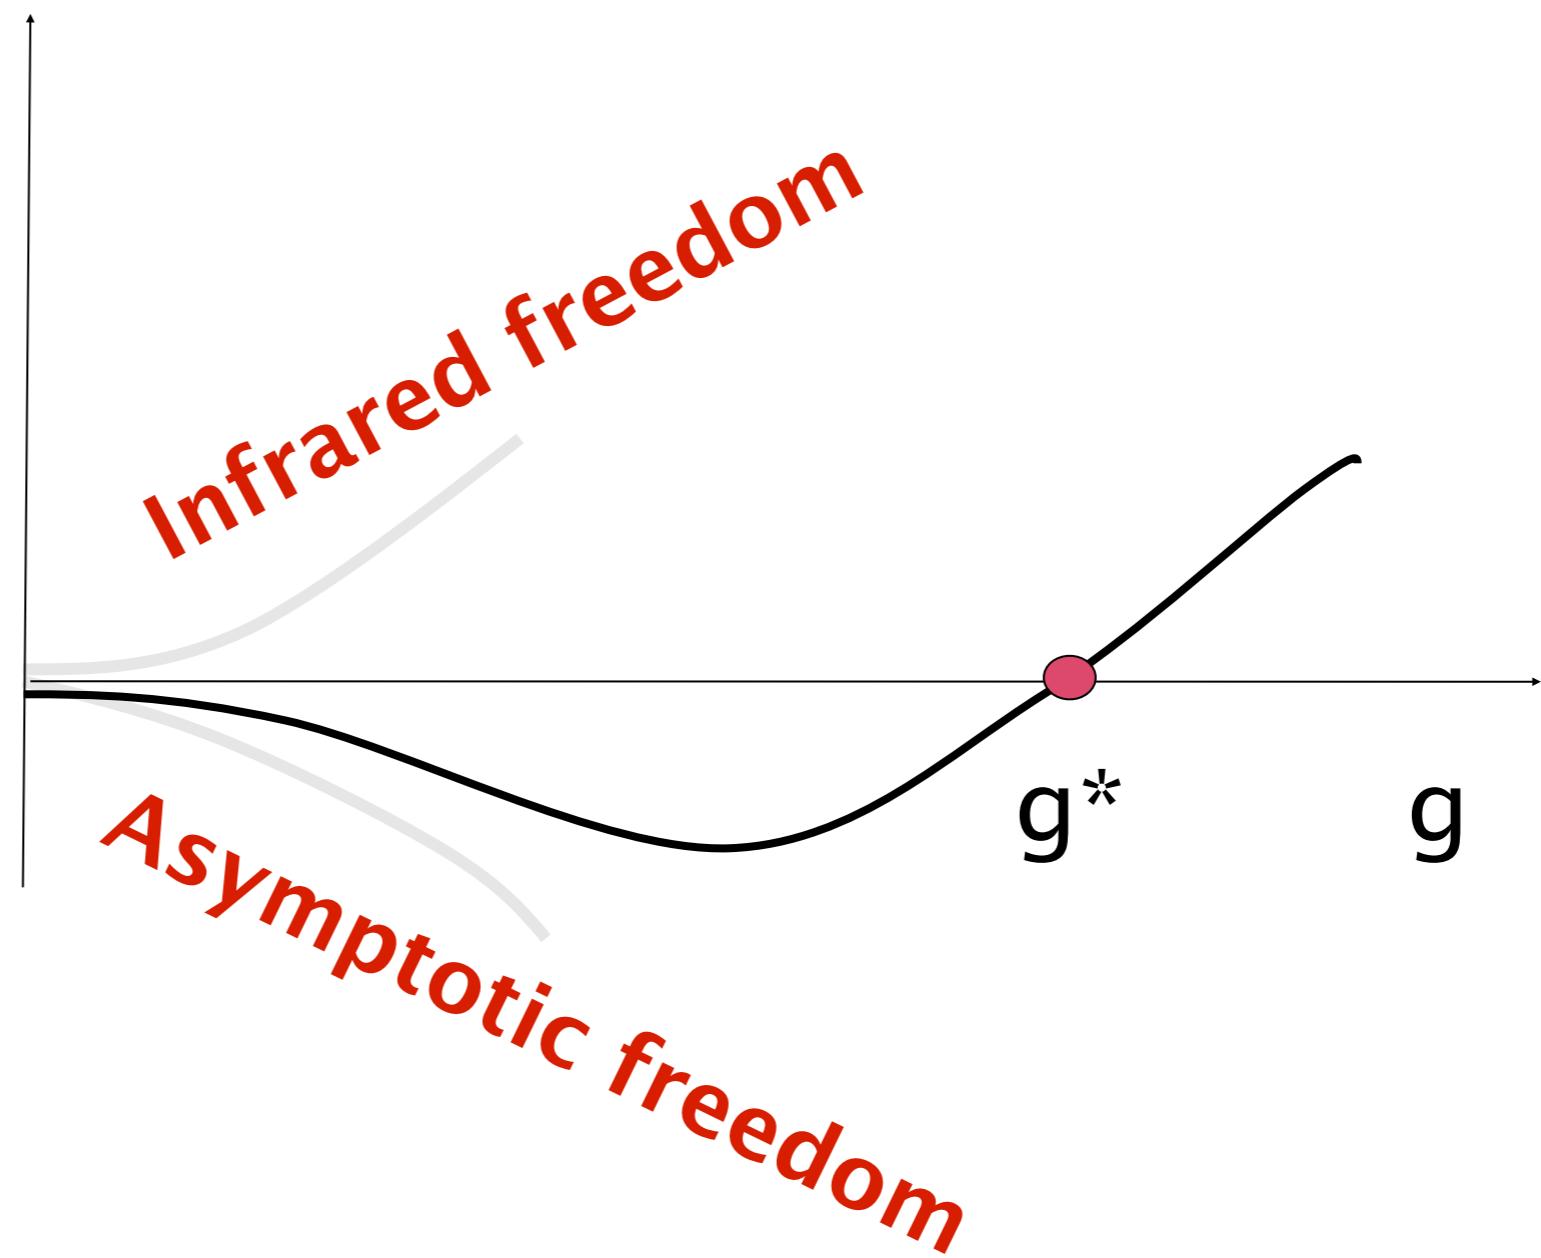

The first two (universal) coefficients  
change sign by varying flavours

Caswell 1974  
Banks,Zaks 1982

$$b_0 = \frac{1}{16\pi^2} \left( 11 - \frac{2}{3} N_f \right) \quad b_1 = \frac{1}{(16\pi^2)^2} \left( 102 - \frac{38}{3} N_f \right)$$

$\uparrow$   $\uparrow$   
 $N=3$   $N=3$

$$\beta(g) = \mu \frac{dg}{d\mu}$$

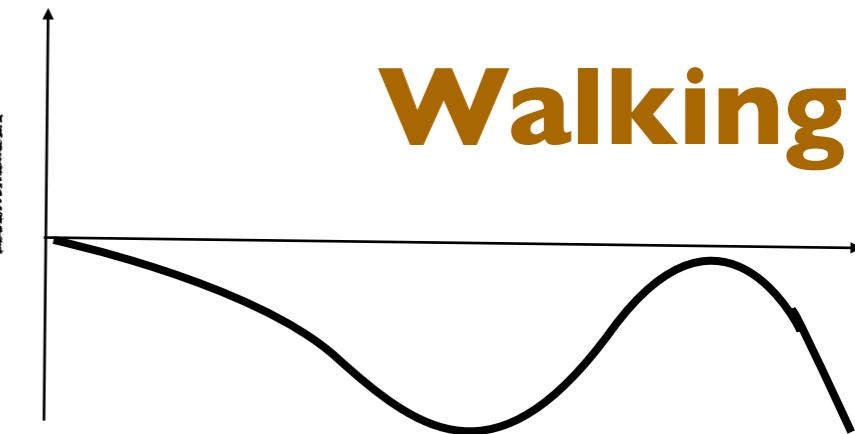

The 4D theory is conformal at  $g^*$  with anomalous dimensions

$\beta(g)$ 

$$N_f < N_f^c$$

$$N_f \leq N_f^c$$

**Walking ?**

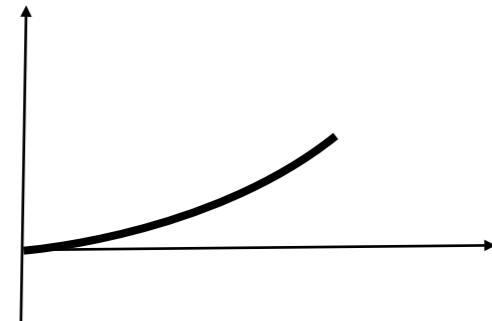

$$N_f^{AF} > N_f > N_f^c$$

**IRFP** $g^*$ 

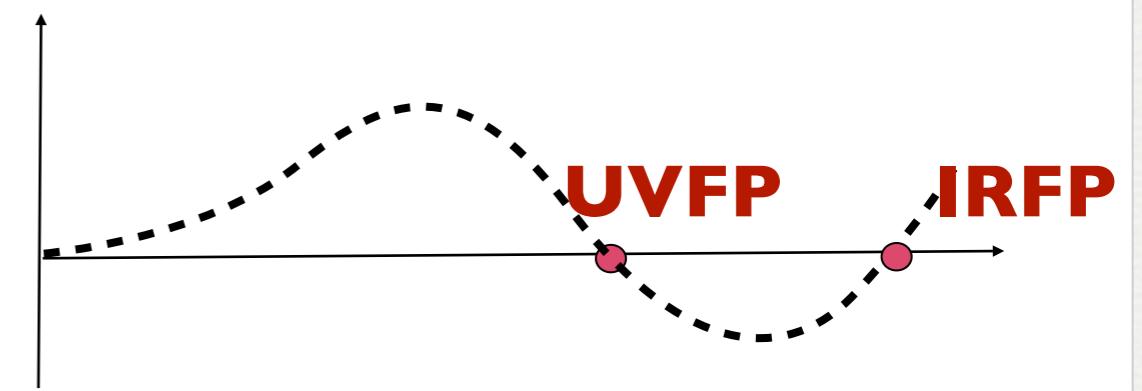

or

**IRFP****UVFP** $g^*$  $g^{**}$ 

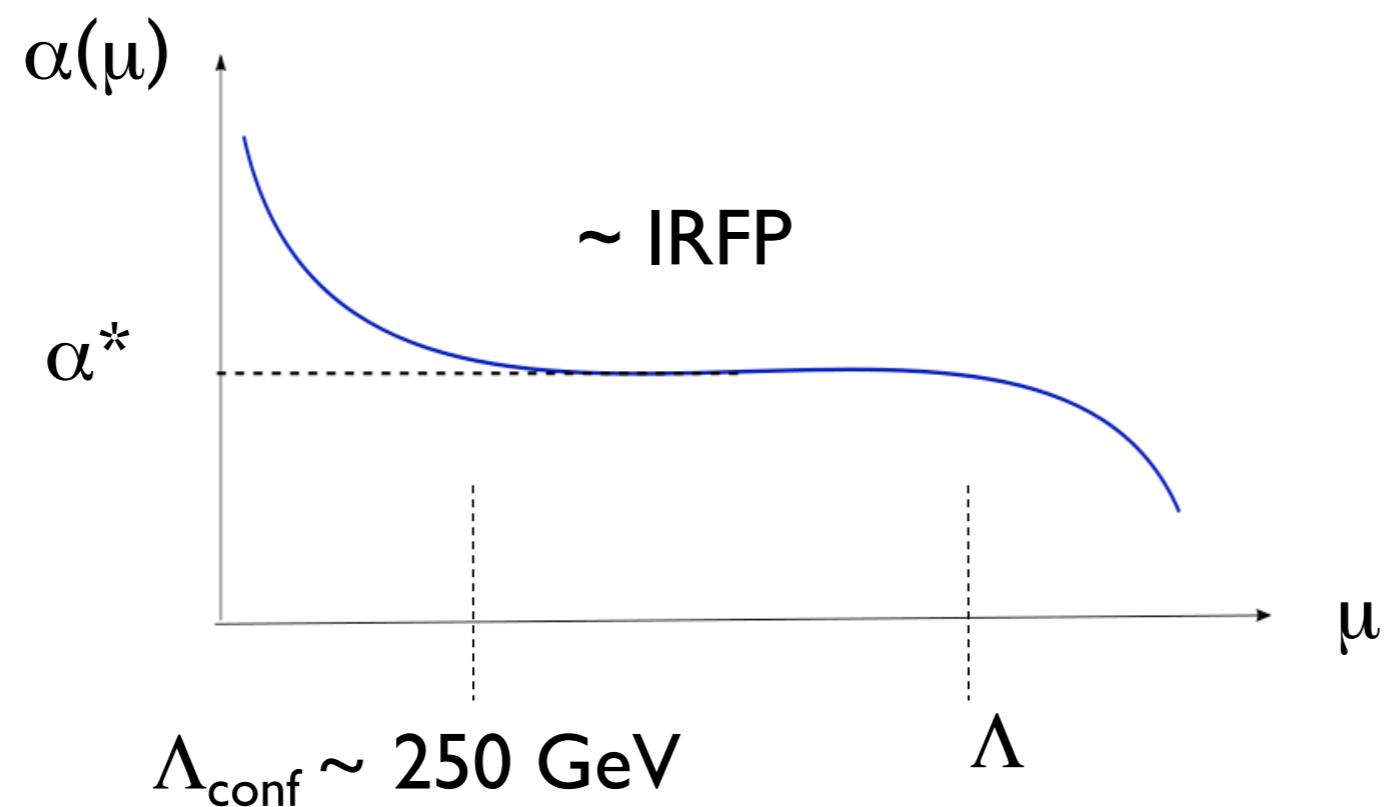

$$N_f > N_f^{AF}$$

or

**UVFP****IRFP**

# Walking regime

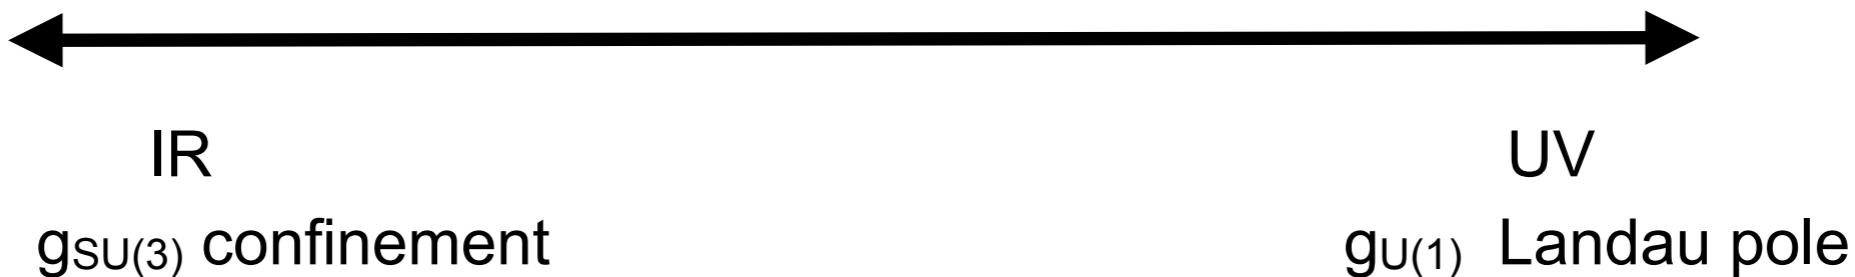

Large and slowly running anomalous dimensions

$$\langle \bar{\psi} \psi \rangle_{\Lambda'} = \langle \bar{\psi} \psi \rangle_{\Lambda} e^{\int_{\Lambda}^{\Lambda'} \frac{d\mu}{\mu} \gamma(\mu)} \simeq \langle \bar{\psi} \psi \rangle_{\Lambda} \left( \frac{\Lambda'}{\Lambda} \right)^{\gamma}$$

produce a large hierarchy of condensates

# The ultraviolet fate of the Standard Model

Before the top discovery [Pendleton, Ross 1981]

- i)  $y_t$  and  $\lambda$  share AF and develop an IRFP if only gauge coupling  $gsu(3)$
- ii) running of light quark masses and charged leptons unaffected by  $y_t$ , light down quark masses receive small contributions
- iii) RG running of  $m_b/m_\tau$  dominated by  $y_t$
- iv) gauge couplings unaffected by  $y_t$  at one loop
- v) CKM mixing angles and phase seem to slowly approach an IRFP at zero

# Scenarios at the Planck scale

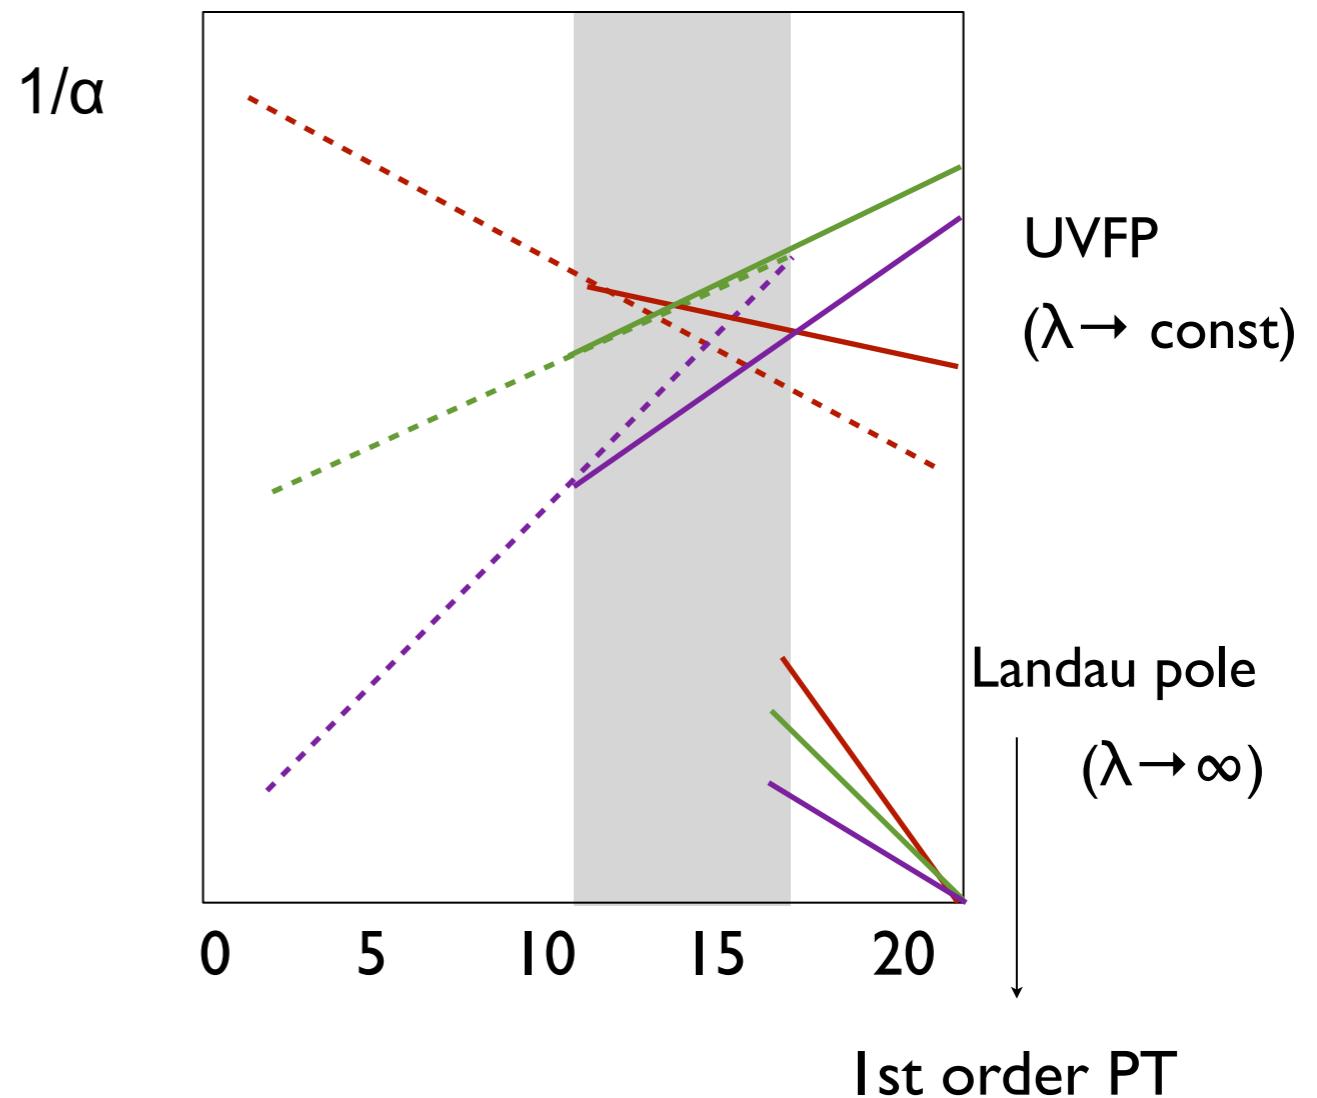

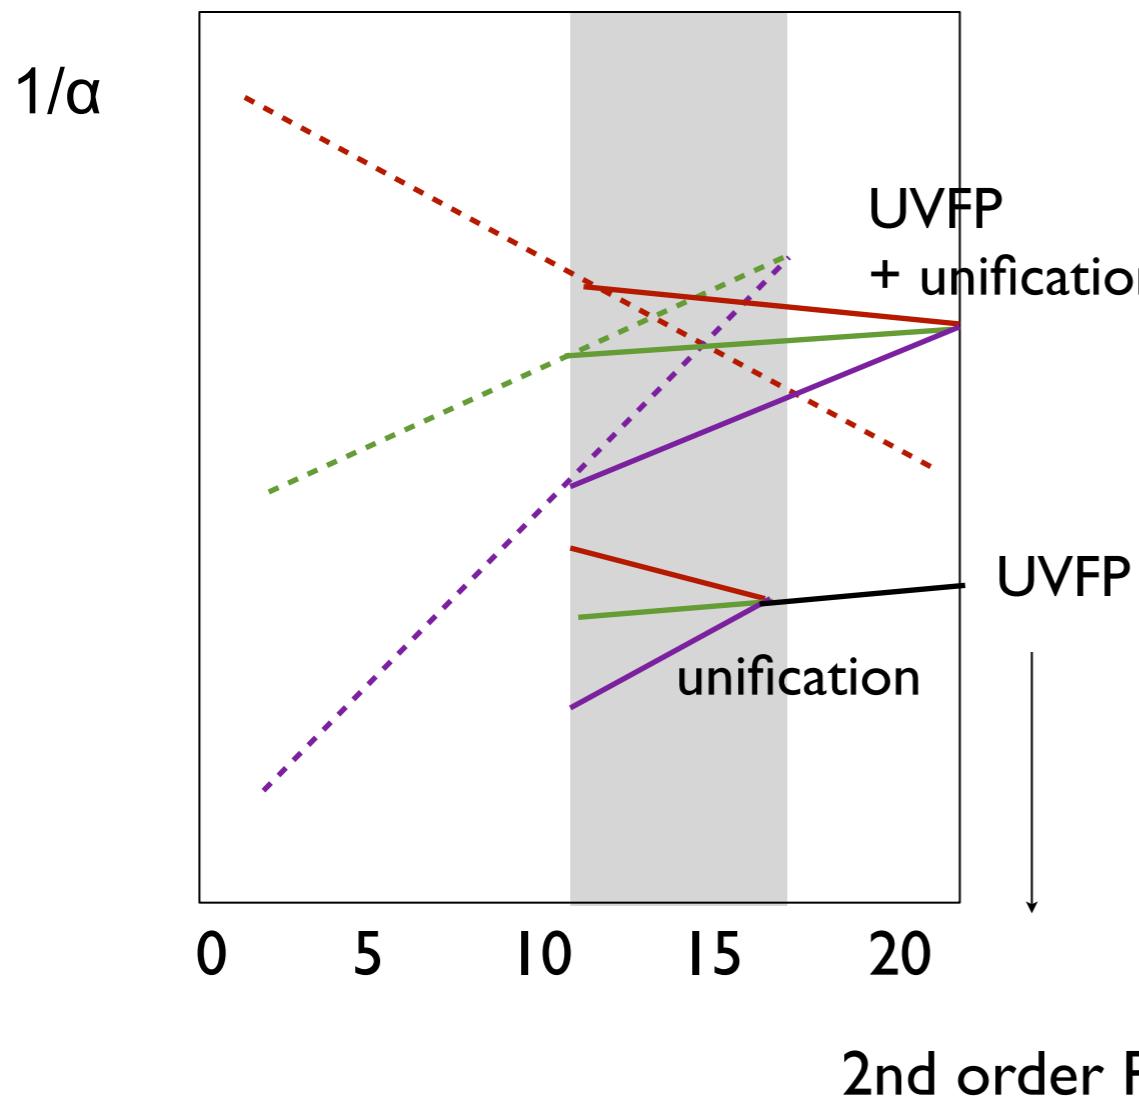

Ingredients

- New particle thresholds
- New symmetries
- Walking (near-conformal)

Caveats

- Failure of e.g. SU(5)
- $g_{1,2,3}$  enter strong coupling
- $\Rightarrow$  no pert theory

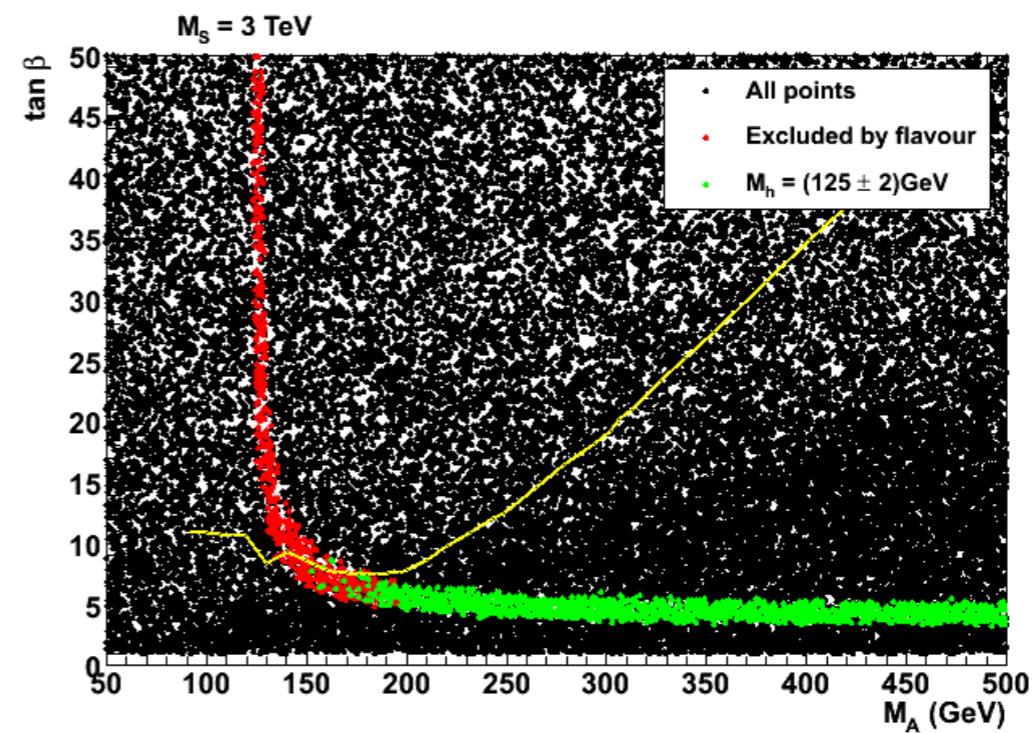

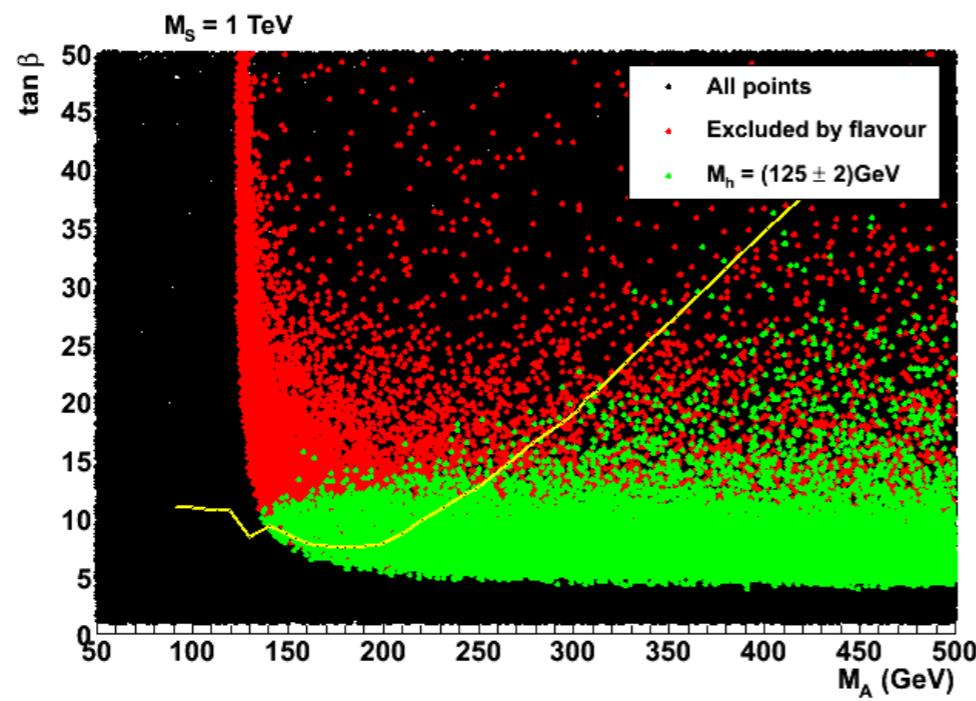

$y_t \rightarrow 0$  for  $\Lambda \rightarrow \Lambda_{\text{Planck}}$  plausible ?  
 $\lambda \rightarrow 0$  or  $\lambda \rightarrow \infty$  or  $\lambda \rightarrow \text{const}$  (asymptotic safety)

# Flavour physics

# Flavor@LHC and new physics

SUSY example: pMSSM maximal mixing scenario (N. Mahmoudi, Moriond 2012)

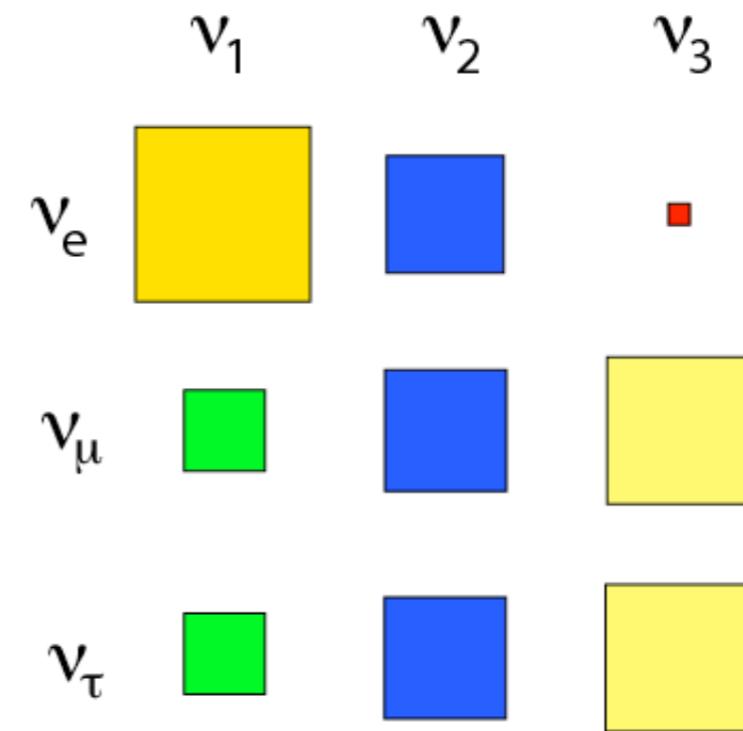

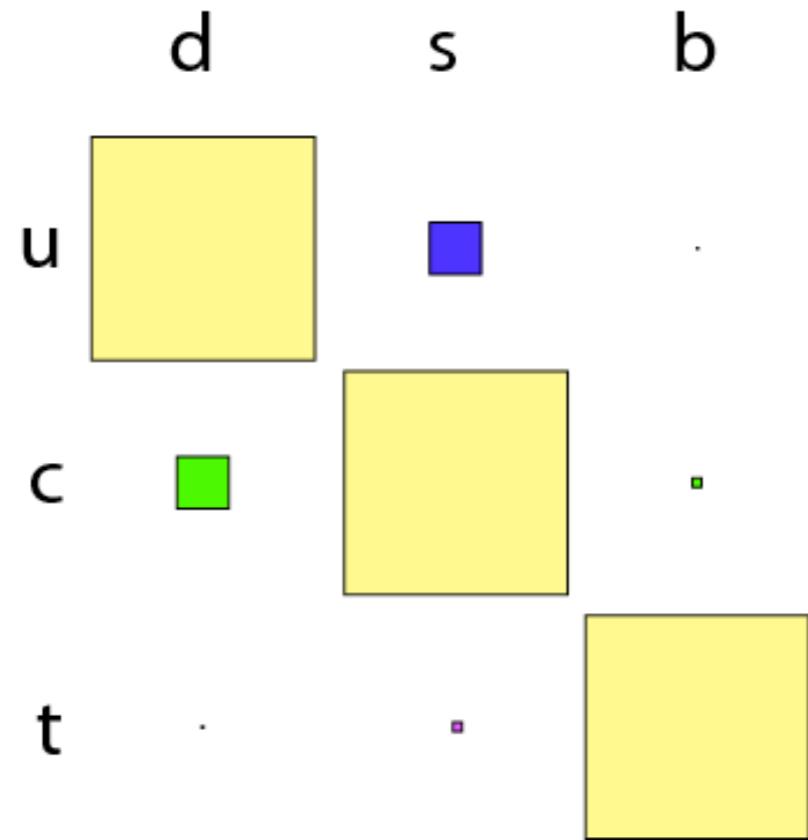

yellow line: CMS limit with 4.6/fb

Flavor constraints from:  $b \rightarrow s\gamma$ ,  $B \rightarrow \tau\nu$  and new LHCb limit on  $B_s \rightarrow \mu^+\mu^-$

Assumed discovery of Higgs at  $(125 \pm 2)$  GeV

Mass & mixing patterns for quarks and leptons

# Experimental mixing patterns

$$\begin{pmatrix} d' \\ s' \\ b' \end{pmatrix} = V_{CKM} \begin{pmatrix} d \\ s \\ b \end{pmatrix}$$

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = V_{PMNS} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$$

$$V_{CKM} = \begin{pmatrix} 1 - \frac{\lambda^2}{2} & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1 - \frac{\lambda^2}{2} & A\lambda^2 \\ A\lambda^3(1 - \rho - i\eta) & -A\lambda^2 & 1 \end{pmatrix} + \dots$$

$$|V_{PMNS}|^2 = \begin{pmatrix} \frac{2}{3} & \frac{1}{3} & 0 \\ \frac{1}{6} & \frac{1}{3} & \frac{1}{2} \\ \frac{1}{6} & \frac{1}{3} & \frac{1}{2} \end{pmatrix} + \dots$$

**CKM matrix almost unity**

**PMNS matrix almost tribimaximal**

# Neutrinos

## A pedagogical mystery

Mass & mixing matrices

DOUBLE-CHOOZ, DAYA-BAY, RENO

$$7.15 \times 10^{-5} \text{ eV}^2 \leq \Delta m_{solar}^2 \leq 8.00 \times 10^{-5} \text{ eV}^2$$
$$2.27 \times 10^{-3} \text{ eV}^2 \leq \Delta m_{atm}^2 \leq 2.55 \times 10^{-3} \text{ eV}^2$$

$$r = \frac{\Delta m_{solar}^2}{\Delta m_{atm}^2} \simeq \frac{1}{30}$$

$$0.275 \leq \sin^2 \theta_{12} \leq 0.342$$

$$0.348 \leq \sin^2 \theta_{23} \leq 0.448$$

$$0.0193 \leq \sin^2 \theta_{13} \leq 0.0290$$

Pattern of mixing angles

$$\sin^2 \theta_{12} \simeq \frac{1}{3}$$

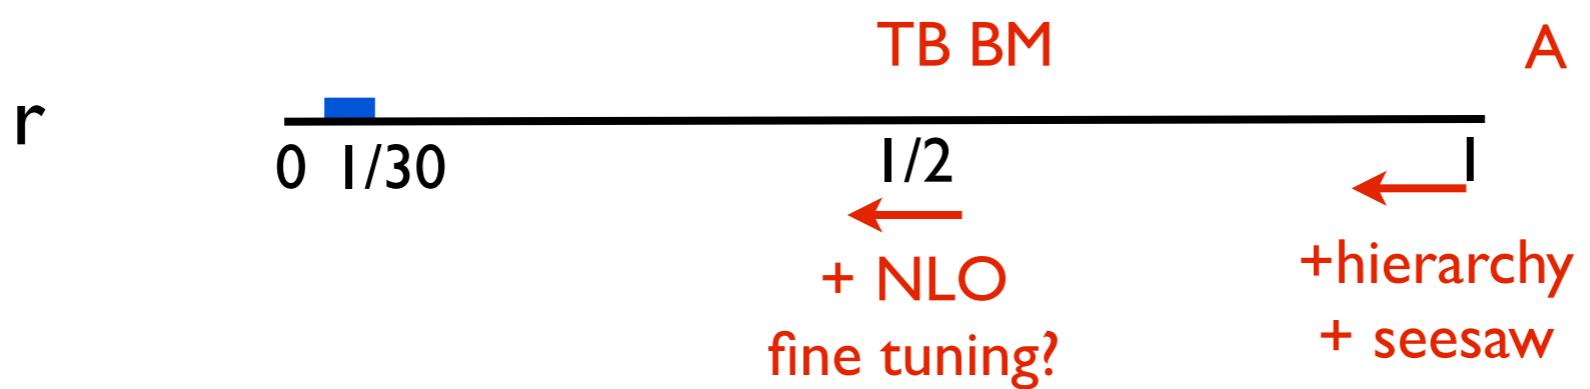

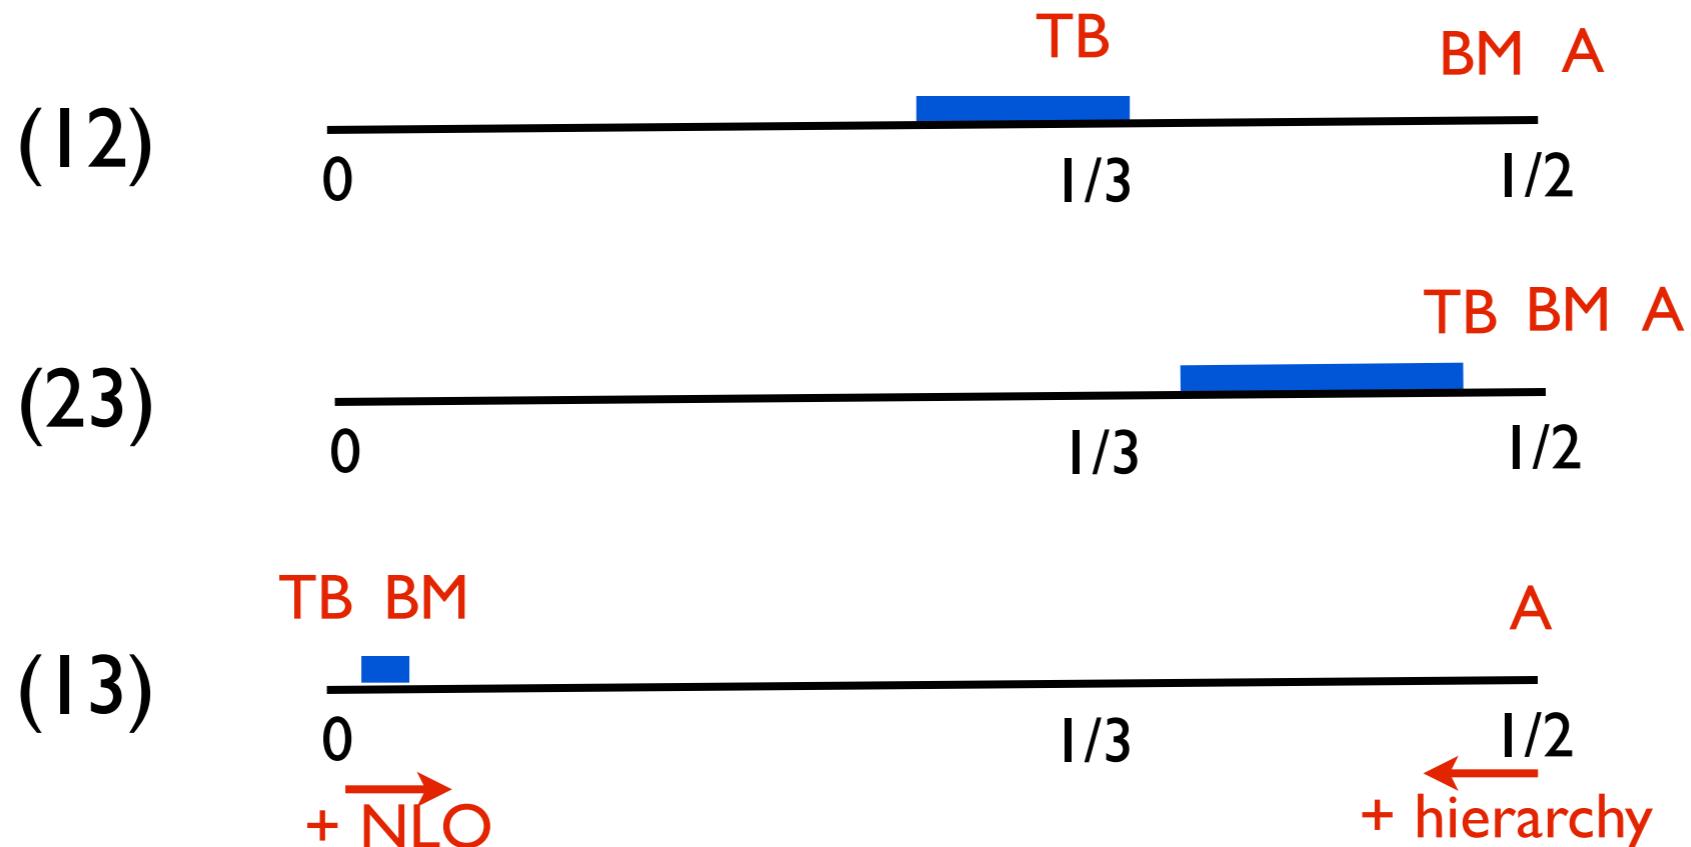

$$\sin^2 \theta_{23} \lesssim \frac{1}{2}$$

$$\sin^2 \theta_{13} > 0$$

$$O(\lambda_C^2) < \sin \theta_{13} < O(\lambda_C) \quad \lambda_C = \sin \theta_C$$

→ quark mixing

# Anarchy versus Hierarchy chaos and order

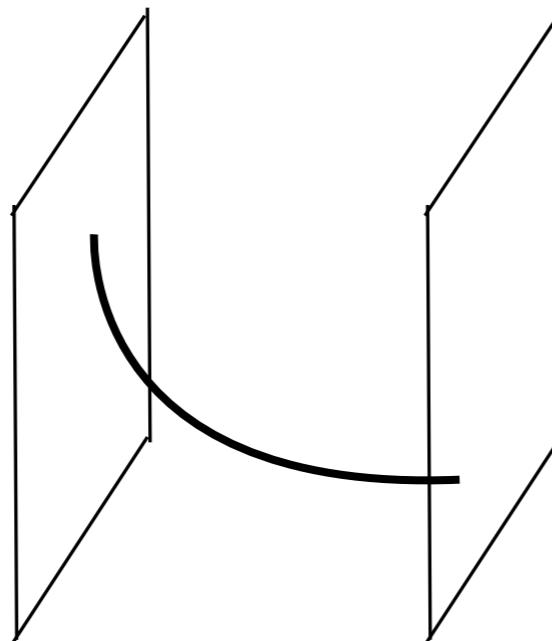

see e.g. Altarelli, Feruglio, Merlo, Stamou 2012

**Is there a unified description for quarks & leptons?**

Many attempts to a unified description: w and w/o extra dimensions

[e.g. RS-A4 Kadosh EP 2011]

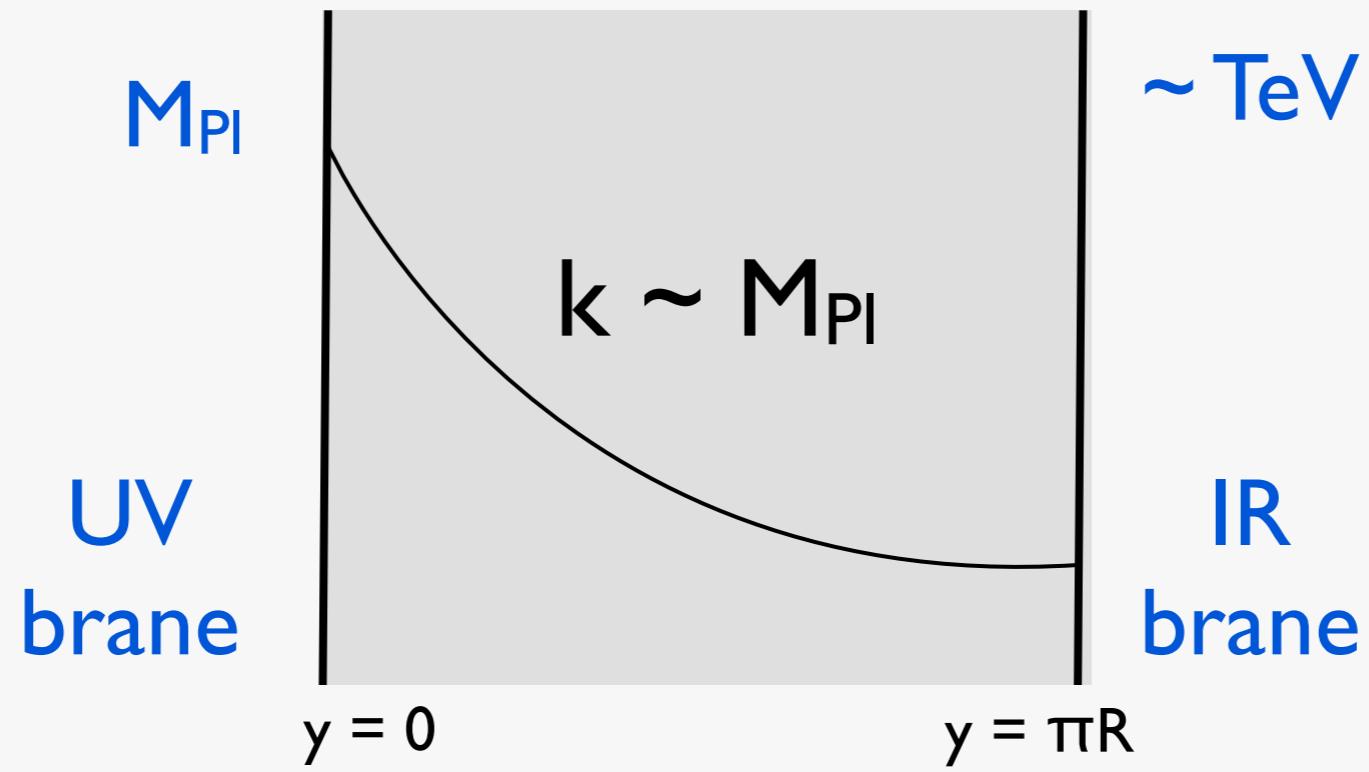

partial compositeness is natural

Powerful discriminators:

EWP parameters S, T - FCNC processes - CP violation - EDMs - LFV

⇒ High precision flavour physics

# $\text{AdS}_5 (S_1/Z_2)$

$$E(y) \sim k e^{-ky}$$

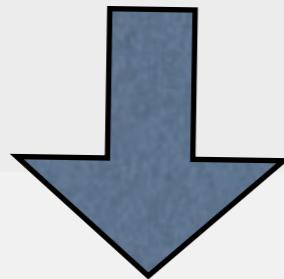

Two scales:  $k_{\text{UV}} \equiv k \sim M_{\text{Pl}}$   
 $k_{\text{IR}} \equiv k e^{-\pi k R} \quad kR \approx 1 \quad [\text{KK scale}]$

All particles in the bulk  $\Rightarrow$  play with particle localization and symmetries

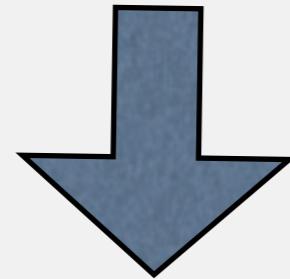

Zero mode fermions peaked at different points in the bulk  $\Rightarrow$  exponential hierarchy of quarks and charged lepton masses explained by tiny hierarchy of bulk masses and  $O(1)$  5D Yukawas

# Anarchy ?      or      Hierarchy ?

No underlying flavor symmetry to constrain the pattern of 5D Yukawa couplings and bulk mass parameters (non-degeneracy)

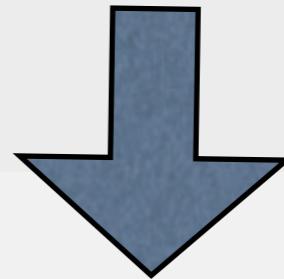

Large FCNC and CP violation  
(little CP problem)

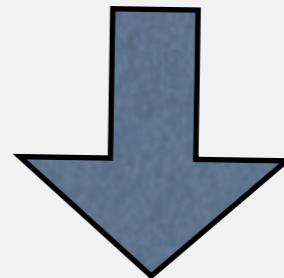

Custodial symmetry augmented with PLR  
to bring down the KK scale to a few TeV

Underlying bulk flavor symmetry  
5D MFV

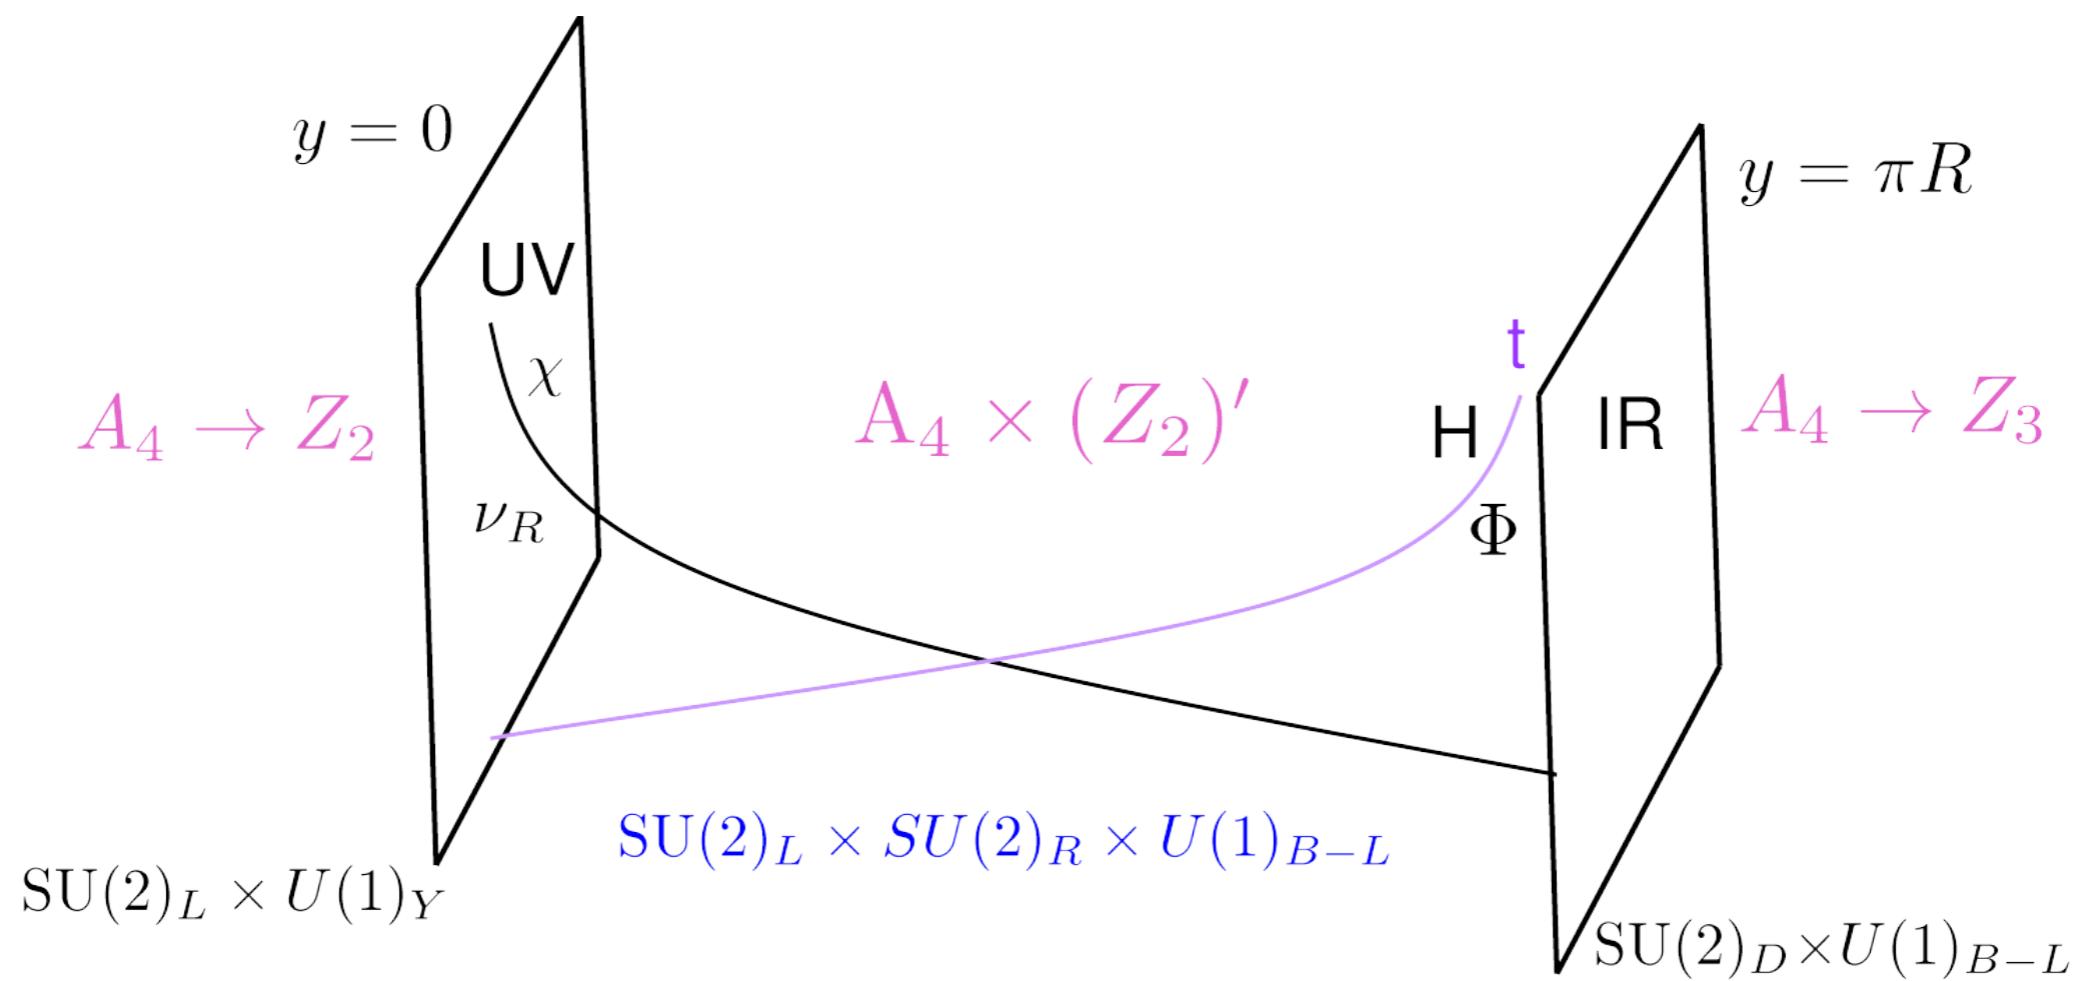

Alignment of Yukawas and masses  
Absence of tree level FCNC

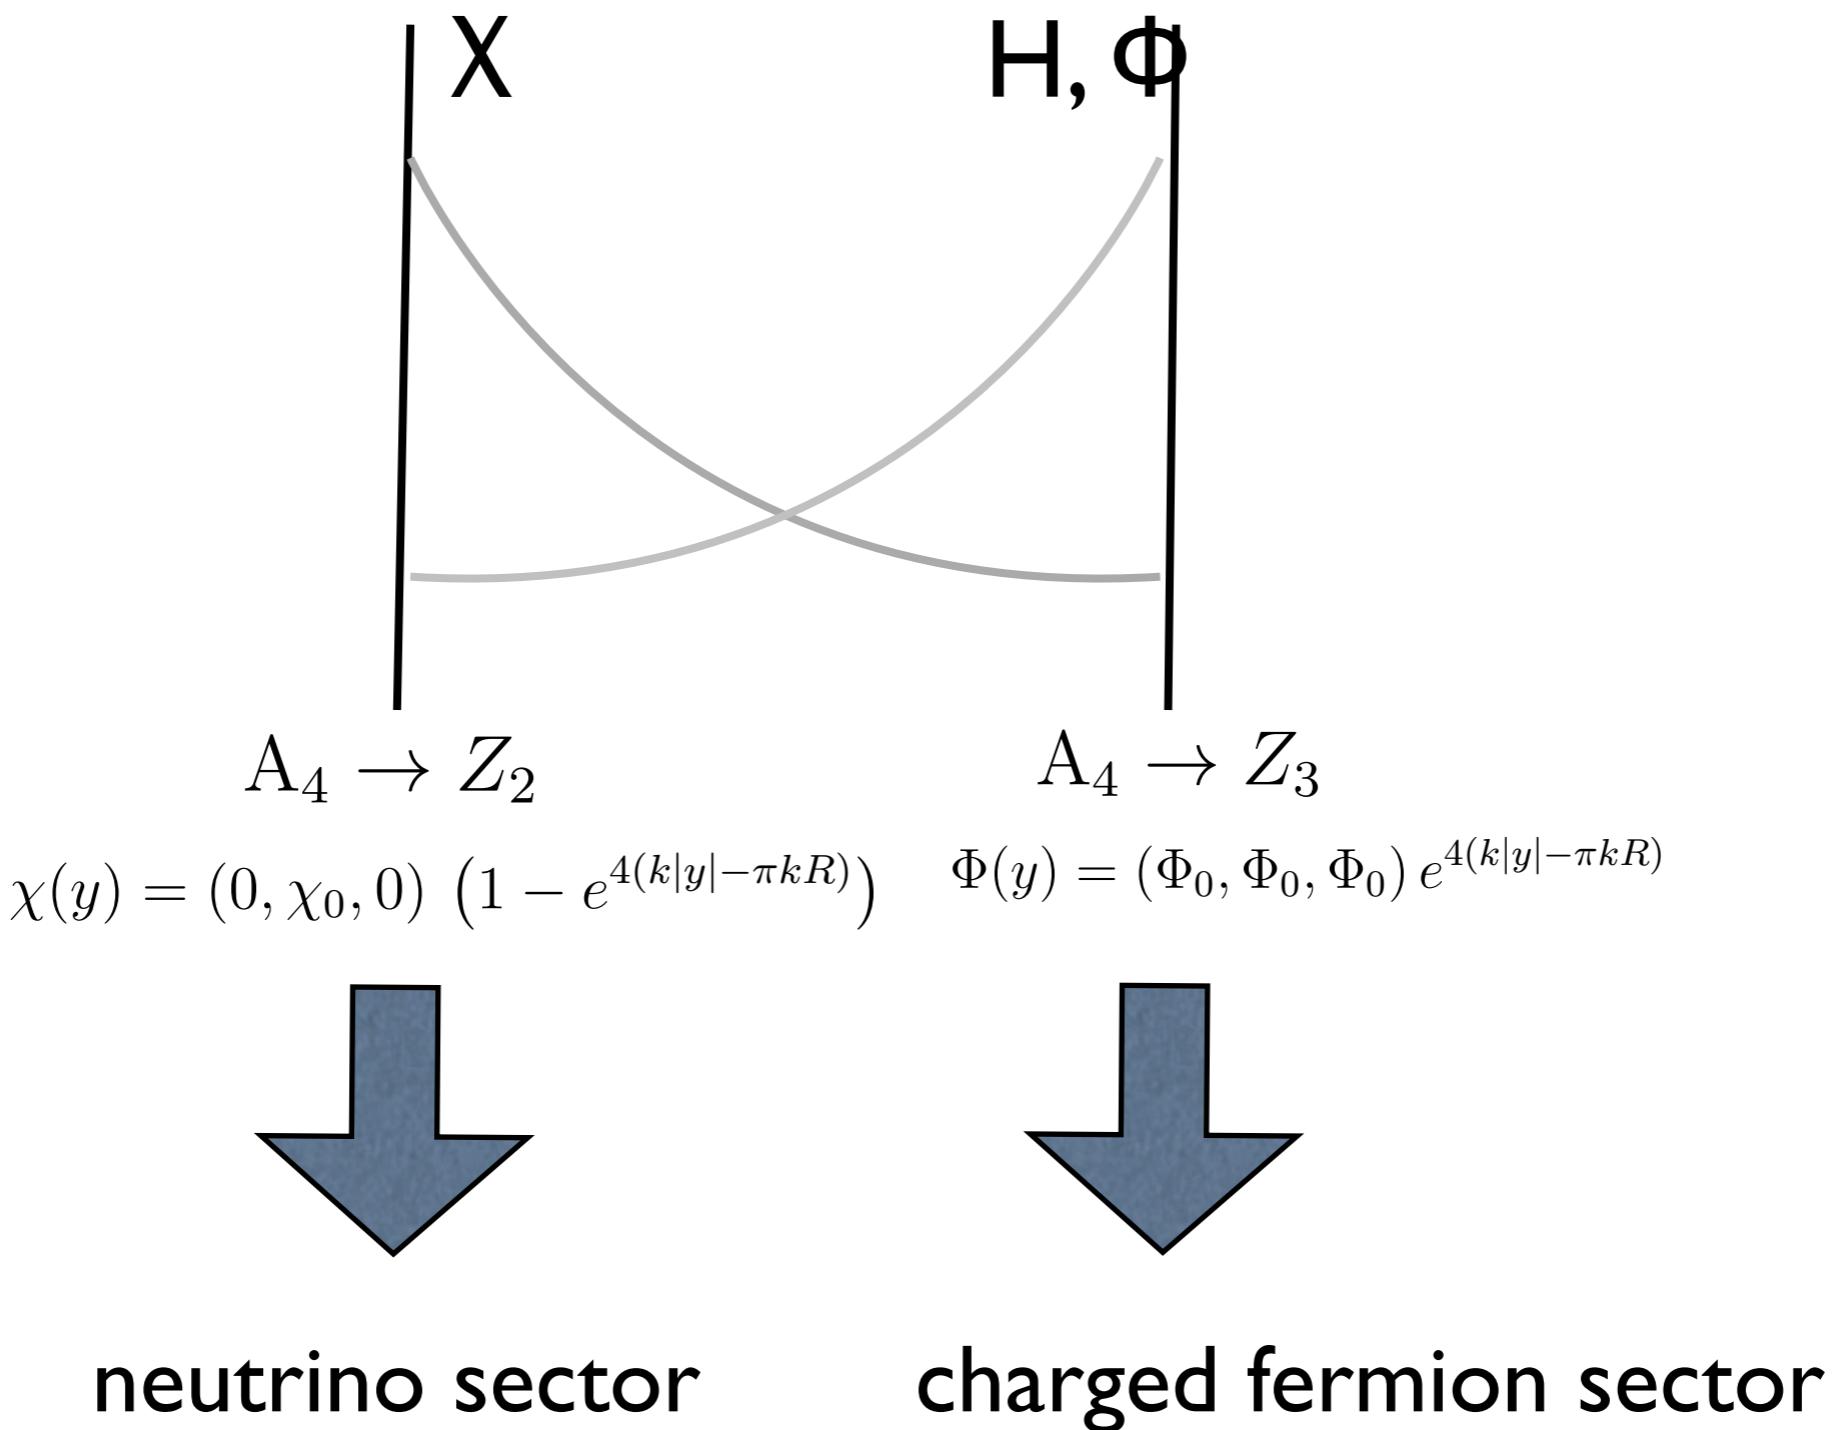

Naturally low KK scale and milder  
little CP problem

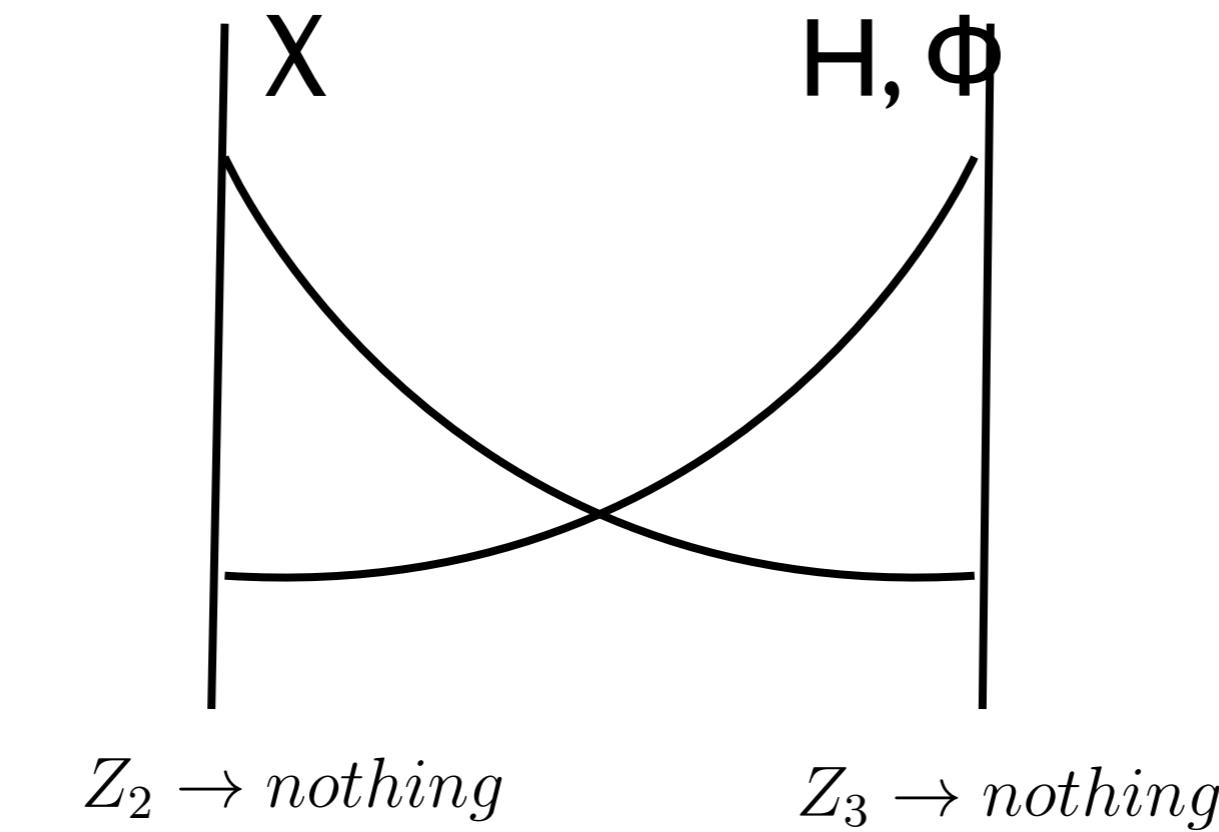

# The RS-A4 model

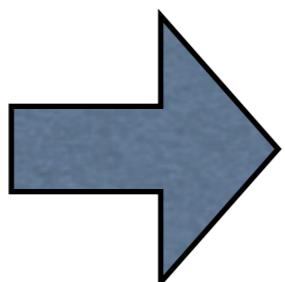

# Masses and mixings at Leading Order

# CKM from cross-talk

cross-brane flavon interactions induce cross-talk  
between neutrino and charged sector

CKM  $\neq$  I  
and deviations from tribimaximal form

# Phenomenology of RS-A4

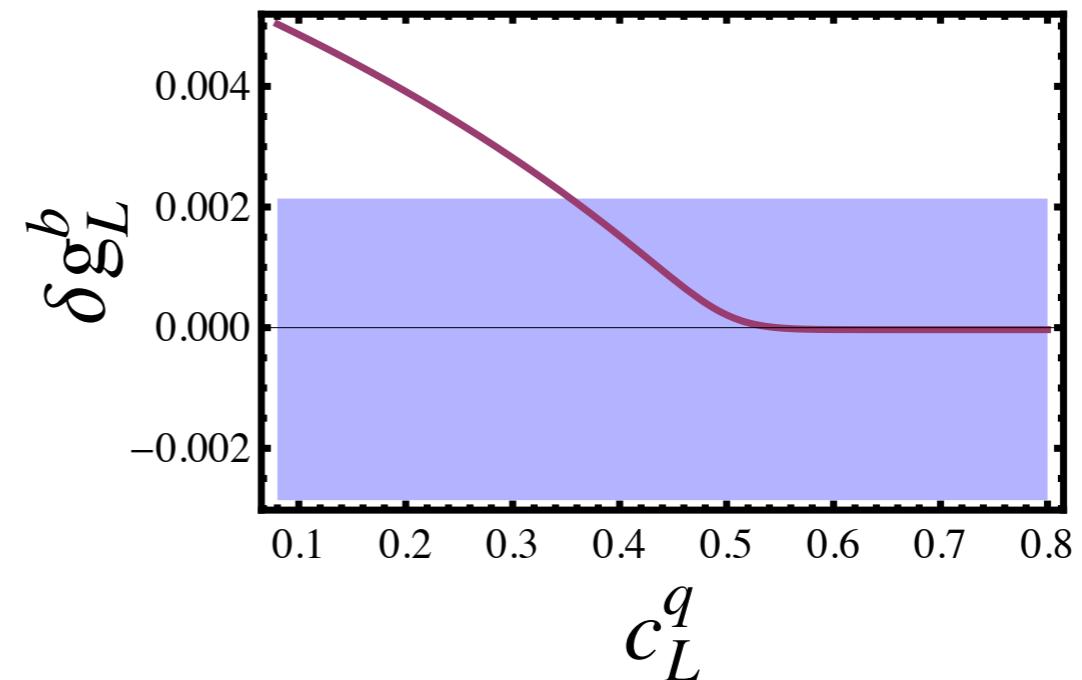

Degenerate  $c_L$

Zbb constraint

Lower  $c_L \leftrightarrow$  higher  $\Lambda_{KK}$

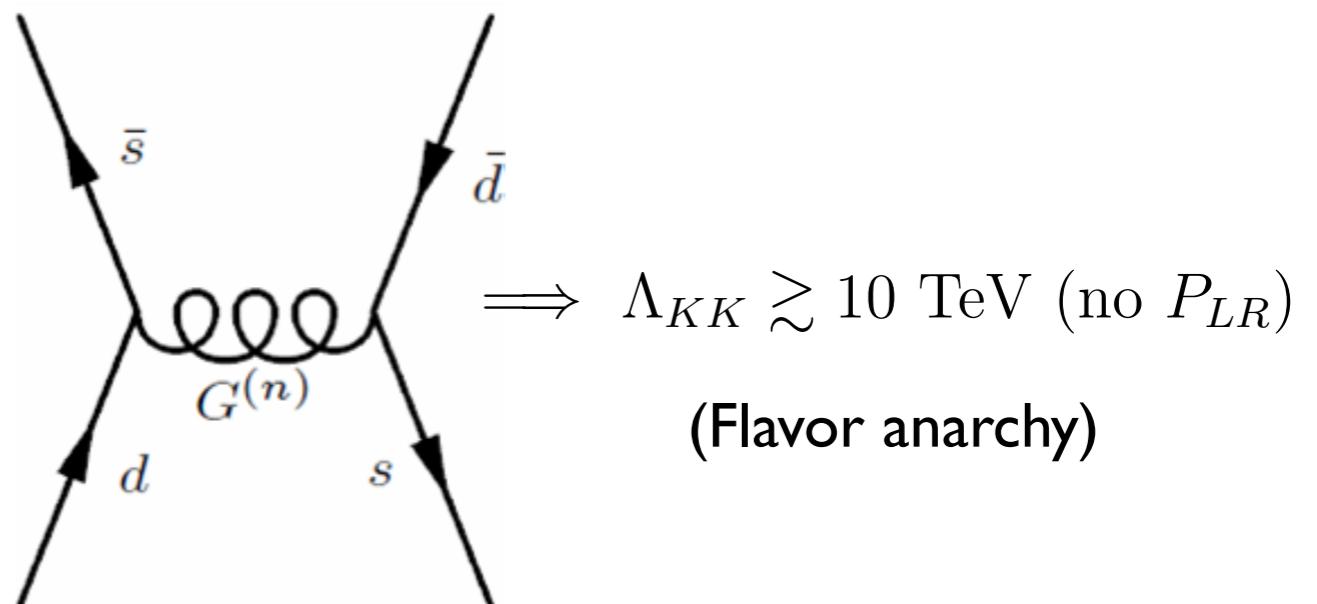

Reduced window for lighter Higgs

$$\Lambda_{KK} = 1.8 \text{ TeV } m_H = 150 \text{ GeV}$$

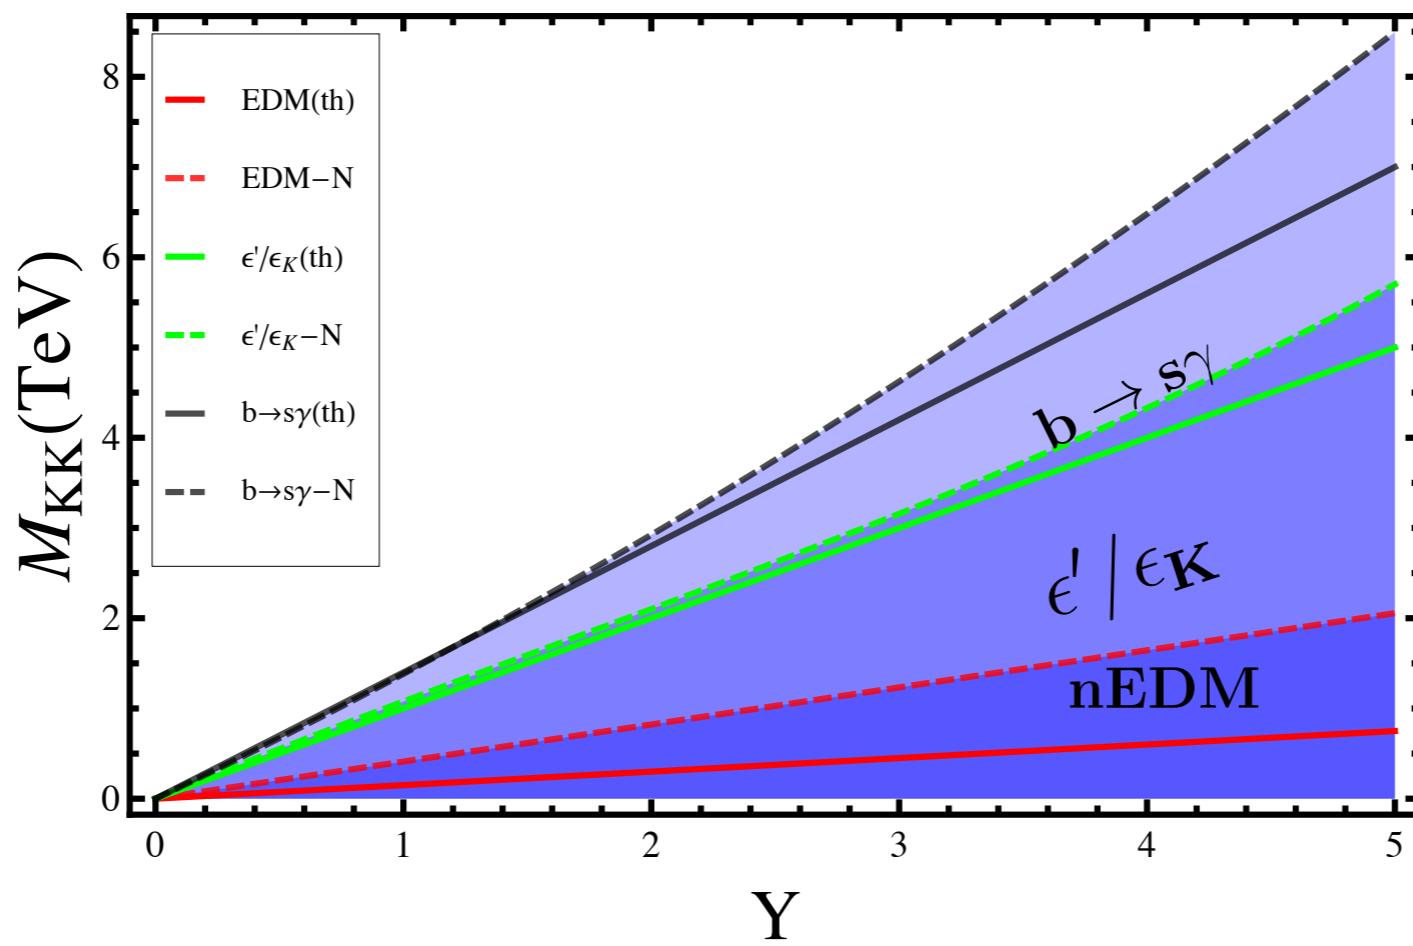

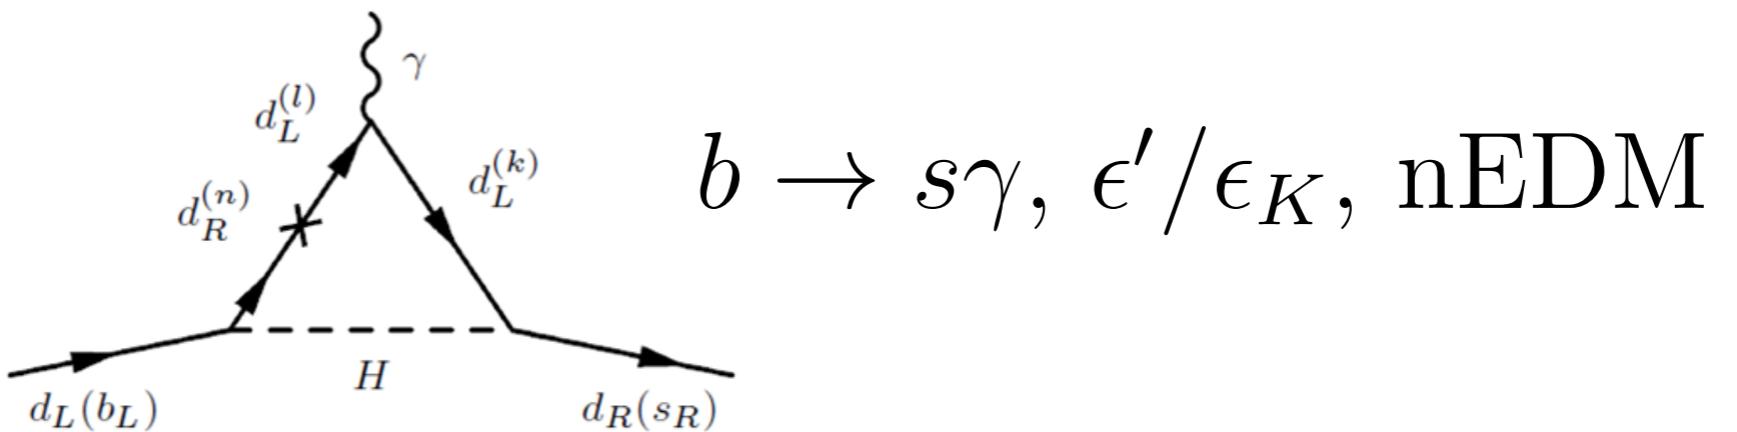

Absence of tree level FCNC

$$\text{e.g. } \epsilon_K^{NP} = 0$$

# Dipole operators for FCNC

# After the LHC

**Higgs  
But no new particles**

Rely on flavour physics bounds  
CKM matrix elements  
B, D mesons rare decays  
CP violation

**Low energy frontier**

Sterile neutrinos below the LHC energy ?  
Electric Dipole Moments (EDMs)  
Higher precision muon ( $g - 2$ )

**New particles**

strongly coupled  
Compositeness      weakly coupled  
Supersymmetry

**High energy frontier**

Higgs, t-quark factory ?  
Planck scale physics (CMB)
